<b>Index</b>	<b>47</b>

This high level library provides objects that represent CircuitPlayground hardware.

# CHAPTER 1

---

## Installation

---

This driver depends on many other libraries! Please install it by downloading the Adafruit library and driver bundle.

# CHAPTER 2

---

## Usage Example

---

Using it is super simple. Simply import the `cpx` variable from the module and then use it.

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.button_a:
        print("Temperature:", cpx.temperature)
    cpx.red_led = cpx.button_b
```

# CHAPTER 3

---

## Contributing

---

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

# CHAPTER 4

---

## Building locally

---

To build this library locally you'll need to install the `circuitpython-build-tools` package.

```
python3 -m venv .env
source .env/bin/activate
pip install circuitpython-build-tools
```

Once installed, make sure you are in the virtual environment:

```
source .env/bin/activate
```

Then run the build:

```
circuitpython-build-bundles --filename_prefix adafruit-circuitpython-
↪circuitplayground --library_location .
```

## 4.1 Sphinx documentation

Sphinx is used to build the documentation based on rST files and comments in the code. First, install dependencies (feel free to reuse the virtual environment from above):

```
python3 -m venv .env
source .env/bin/activate
pip install Sphinx sphinx-rtd-theme
```

Now, once you have the virtual environment activated:

```
cd docs
sphinx-build -E -W -b html . _build/html
```

This will output the documentation to `docs/_build/html`. Open the `index.html` in your browser to view them. It will also (due to `-W`) error out on any warning like Travis will. This is a good way to locally verify it will pass.

# CHAPTER 5

---

## Table of Contents

---

### 5.1 Simple test

Ensure your device works with this simple test.

Listing 1: examples/circuitplayground\_acceleration.py

```
1 import time
2 from adafruit_circuitplayground.express import cpx
3
4 while True:
5     x, y, z = cpx.acceleration
6     print(x, y, z)
7
8     time.sleep(0.1)
```

Listing 2: examples/circuitplayground\_pixels\_simpletest.py

```

## 5.2 adafruit\_circuitplayground.express

CircuitPython driver from [CircuitPlayground Express](#).

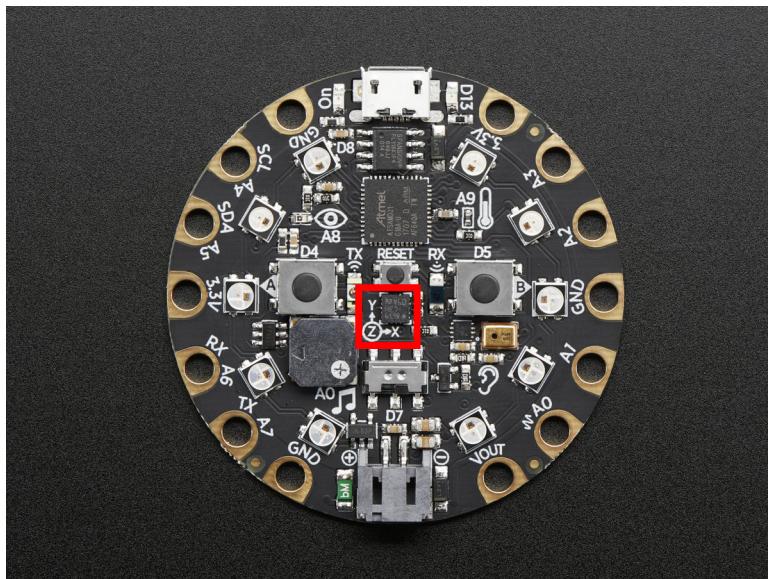

- Author(s): Kattni Rembor, Scott Shawcroft

**class** adafruit\_circuitplayground.express.**Express**

Represents a single CircuitPlayground Express. Do not use more than one at a time.

**acceleration**

Obtain data from the x, y and z axes.

This example prints the values. Try moving the board to see how the printed values change.

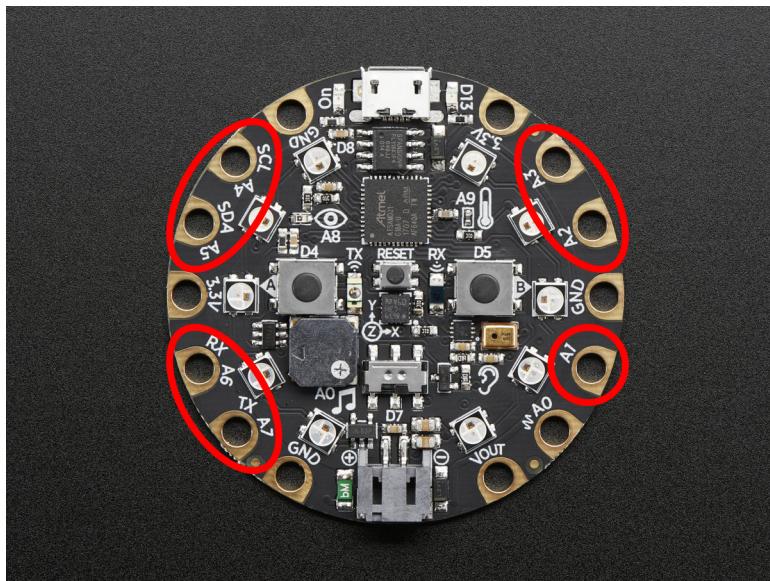

```
from adafruit_circuitplayground.express import cpx

while True:
    x, y, z = cpx.acceleration
    print(x, y, z)
```

#### `adjust_touch_threshold(adjustment)`

Adjust the threshold needed to activate the capacitive touch pads. Higher numbers make the touch pads less sensitive.

Parameters `adjustment` (`int`) – The desired threshold increase

```
from adafruit_circuitplayground.express import cpx

cpx.adjust_touch_threshold(200)
```

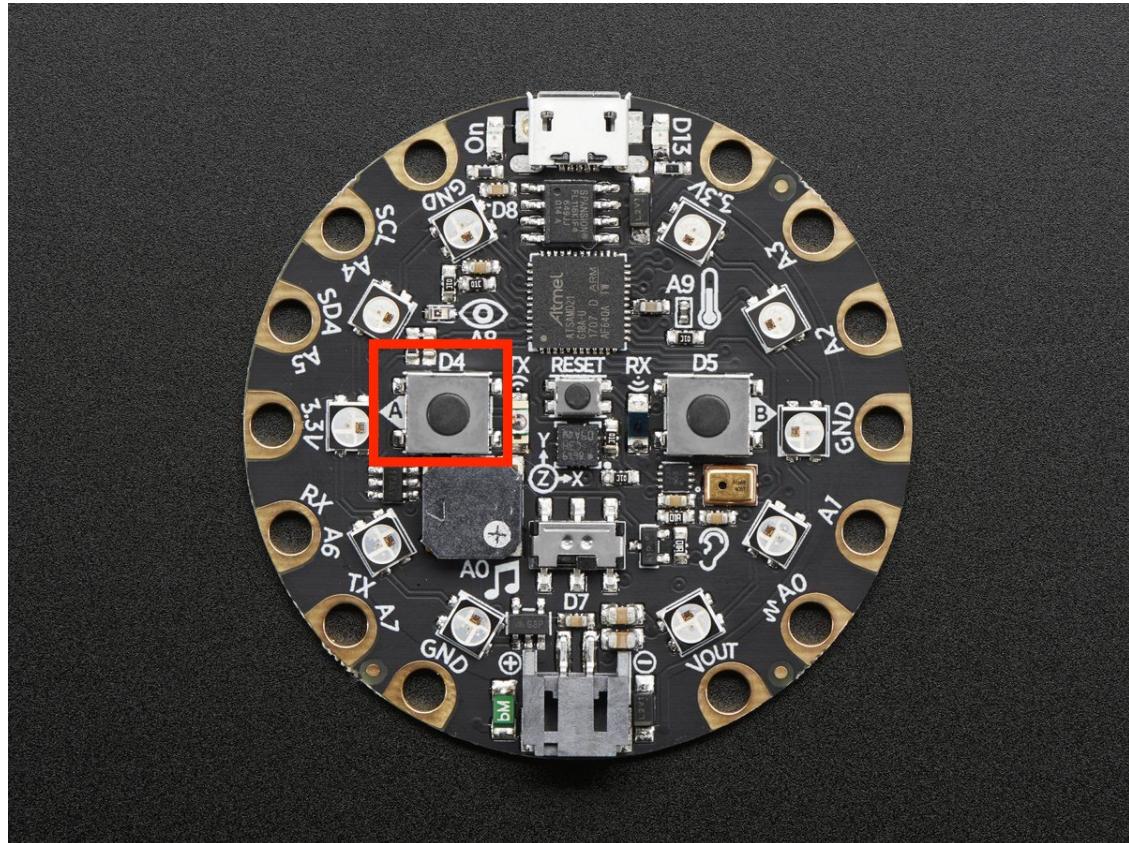

(continues on next page)

(continued from previous page)

```
while True:  
    if cpx.touch_A1:  
        print('Touched pad A1')
```

### button\_a

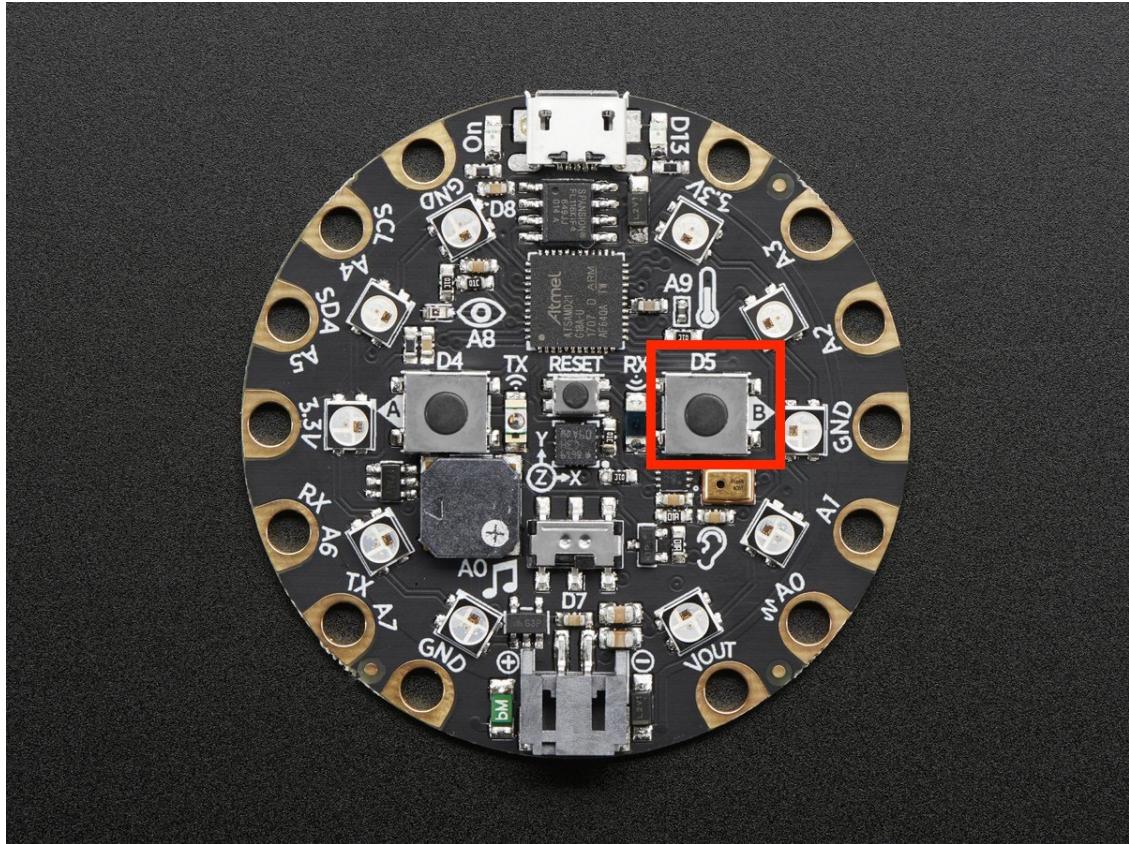

True when Button A is pressed. False if not.

```
from adafruit_circuitplayground.express import cpx  
  
while True:  
    if cpx.button_a:  
        print("Button A pressed!")
```

### button\_b

True when Button B is pressed. False if not.

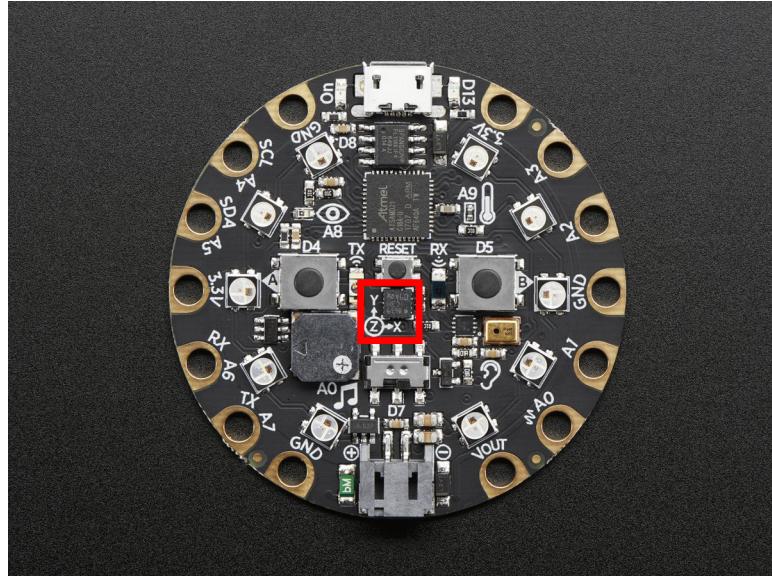

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.button_b:
        print("Button B pressed!")
```

#### **detect\_taps**

Configure what type of tap is detected by `cpx.tapped`. Use 1 for single-tap detection and 2 for double-tap detection. This does nothing without `cpx.tapped`.

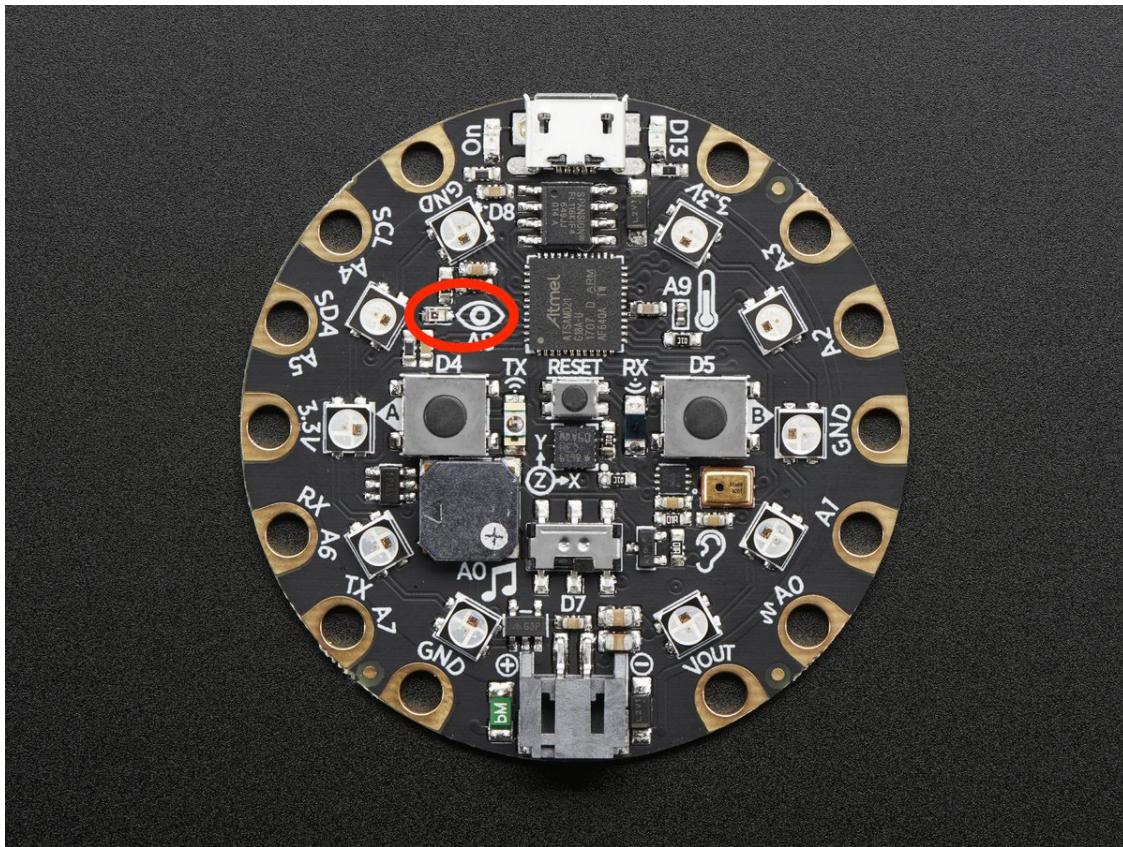

```
from adafruit_circuitplayground.express import cpx

cpx.detect_taps = 1
while True:
    if cpx.tapped:
        print("Single tap detected!")
```

### light

The brightness of the CircuitPlayground in approximate Lux.

Try covering the sensor next to the eye to see it change.

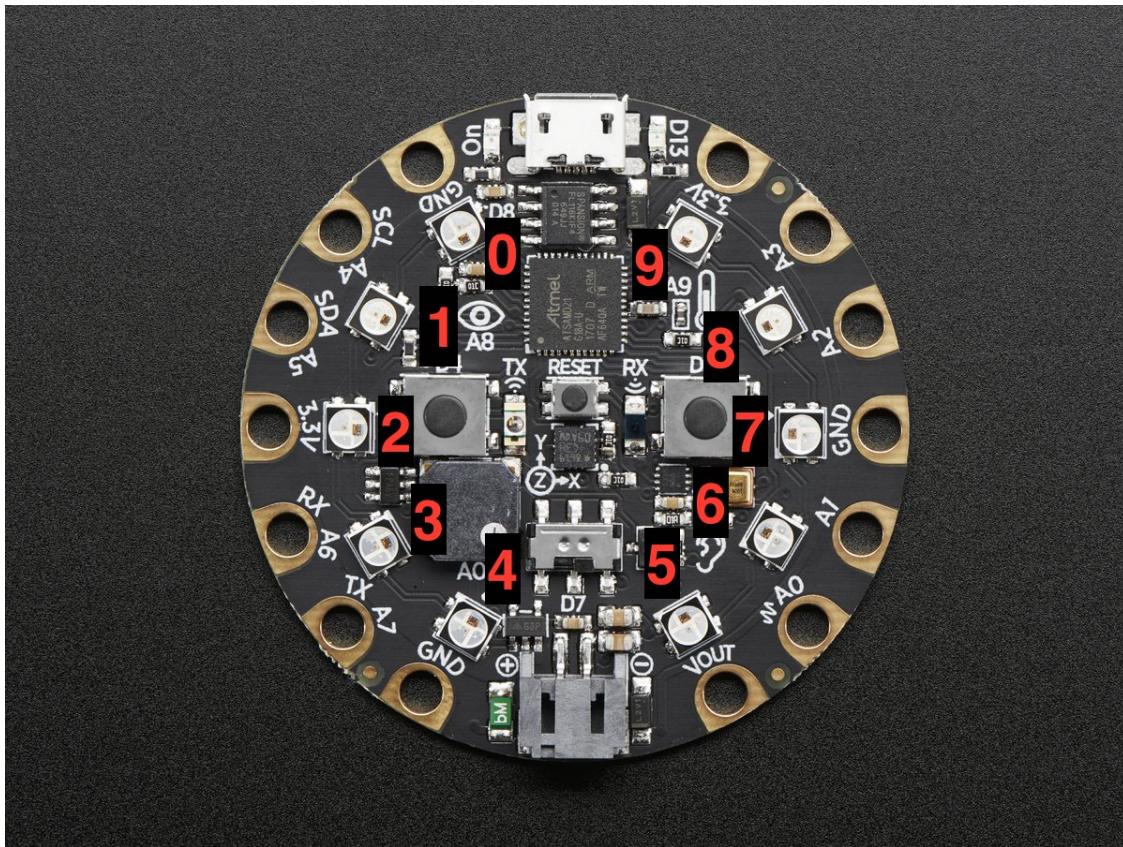

```
from adafruit_circuitplayground.express import cpx
import time

while True:
    print("Lux:", cpx.light)
    time.sleep(1)
```

### **pixels**

Sequence like object representing the ten NeoPixels around the outside of the CircuitPlayground. Each pixel is at a certain index in the sequence as labeled below. Colors can be RGB hex like 0x110000 for red where each two digits are a color (0xRRGGBB) or a tuple like (17, 0, 0) where (R, G, B). Set the global brightness using any number from 0 to 1 to represent a percentage, i.e. 0.3 sets global brightness to 30%.

See `neopixel.NeoPixel` for more info.

Here is an example that sets the first pixel green and the second red.

```
from adafruit_circuitplayground.express import cpx

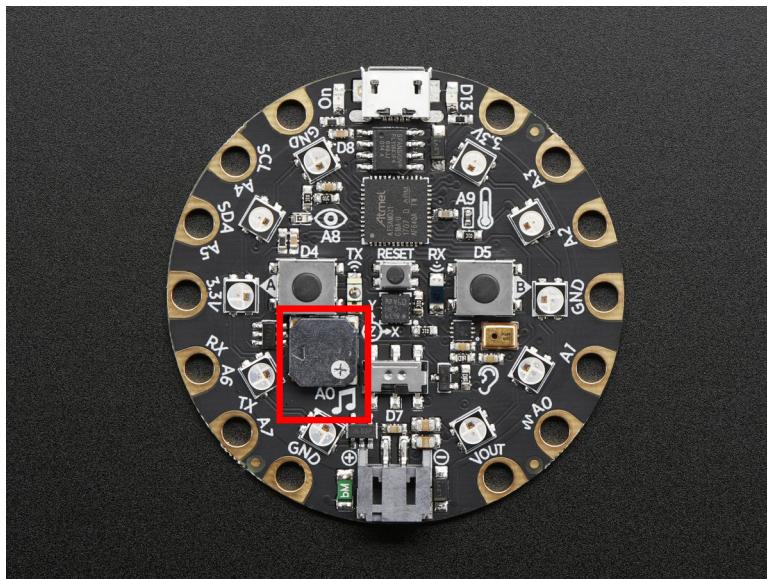

cpx.pixels.brightness = 0.3
cpx.pixels[0] = 0x003000
cpx.pixels[9] = (30, 0, 0)

# Wait forever. CTRL-C to quit.
while True:
    pass
```

### play\_file(file\_name)

Play a .wav file using the onboard speaker.

**Parameters** `file_name` – The name of your .wav file in quotation marks including .wav

```
from adafruit_circuitplayground.express import cpx

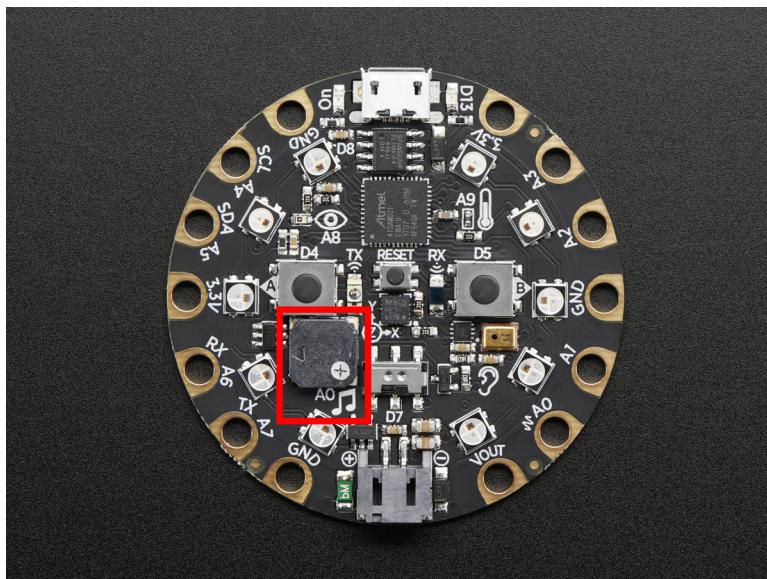

while True:
    if cpx.button_a:
        cpx.play_file("laugh.wav")
    elif cpx.button_b:
        cpx.play_file("rimshot.wav")
```

### play\_tone (*frequency, duration*)

Produce a tone using the speaker. Try changing frequency to change the pitch of the tone.

#### Parameters

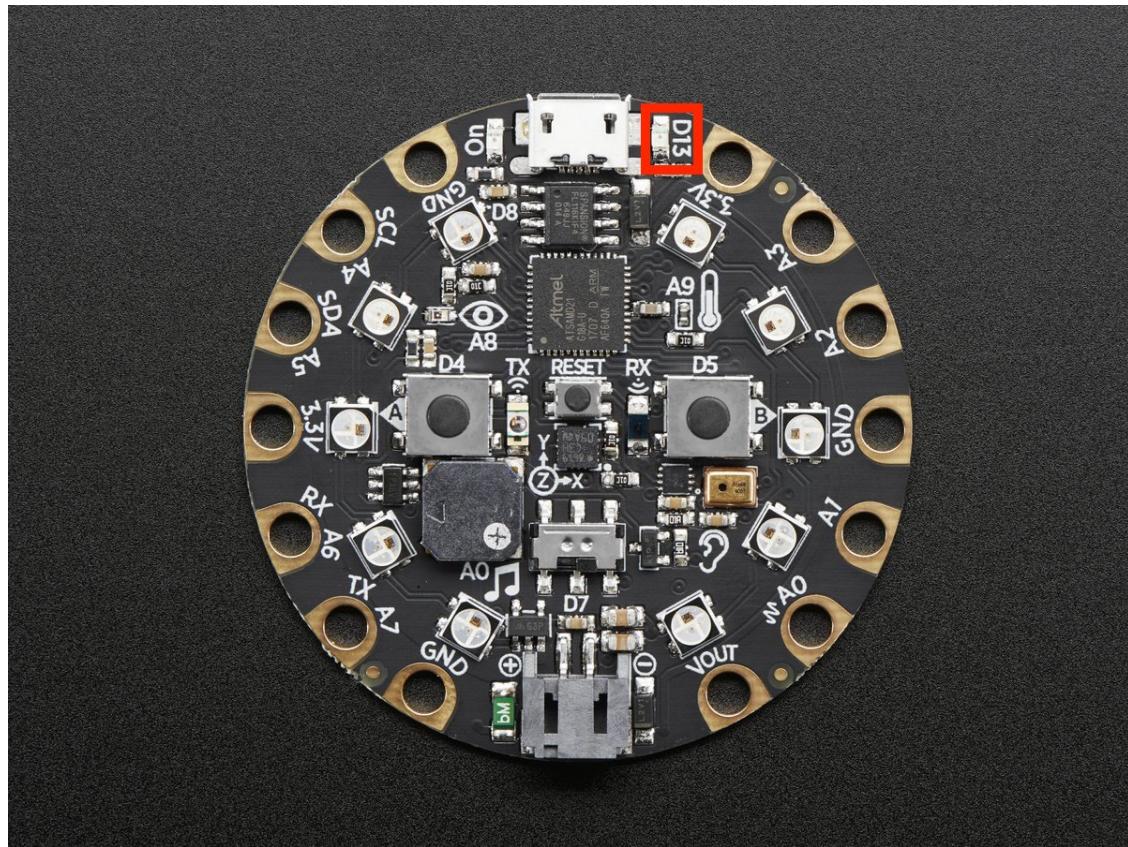

- **frequency** (*int*) – The frequency of the tone in Hz
- **duration** (*float*) – The duration of the tone in seconds

```
from adafruit_circuitplayground.express import cpx  
  
cpx.play_tone(440, 1)
```

### red\_led

The red led next to the USB plug marked D13.

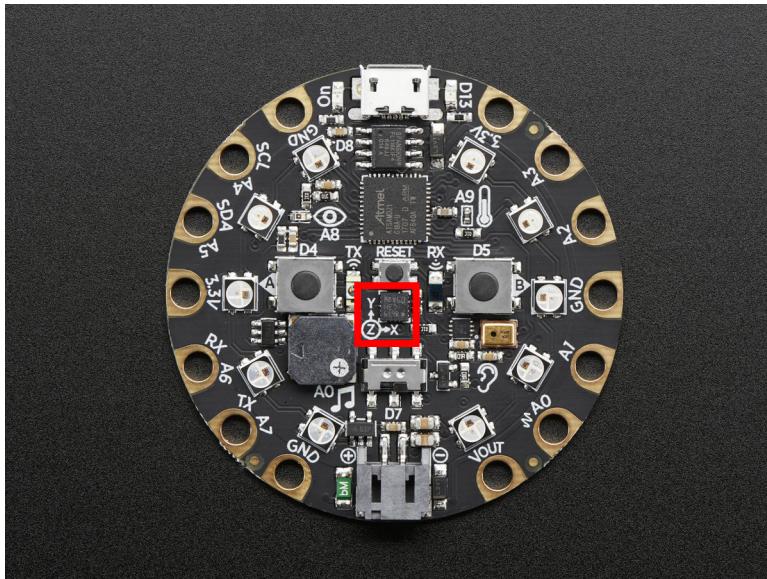

```
from adafruit_circuitplayground.express import cpx  
import time  
  
while True:  
    cpx.red_led = True  
    time.sleep(1)  
    cpx.red_led = False  
    time.sleep(1)
```

### shake (shake\_threshold=30)

Detect when device is shaken.

**Parameters** `shake_threshold(int)` – The threshold shake must exceed to return true (Default: 30)

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.shake():
        print("Shake detected!")
```

Decreasing `shake_threshold` increases shake sensitivity, i.e. the code will return a shake detected more easily with a lower `shake_threshold`. Increasing it causes the opposite. `shake_threshold` requires a minimum value of 10 - 10 is the value when the board is not moving, therefore anything less than 10 will erroneously report a constant shake detected.

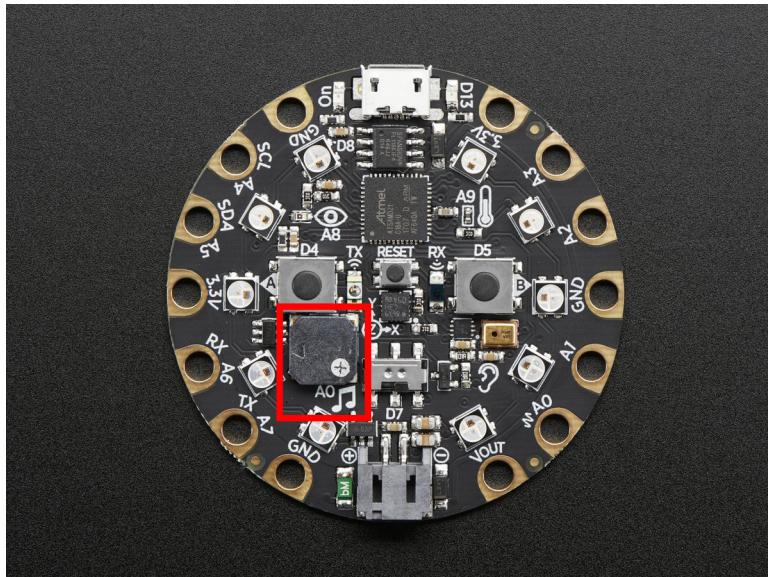

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.shake(shake_threshold=20):
        print("Shake detected more easily than before!")
```

### `start_tone`(*frequency*)

Produce a tone using the speaker. Try changing frequency to change the pitch of the tone.

**Parameters** `frequency` (*int*) – The frequency of the tone in Hz

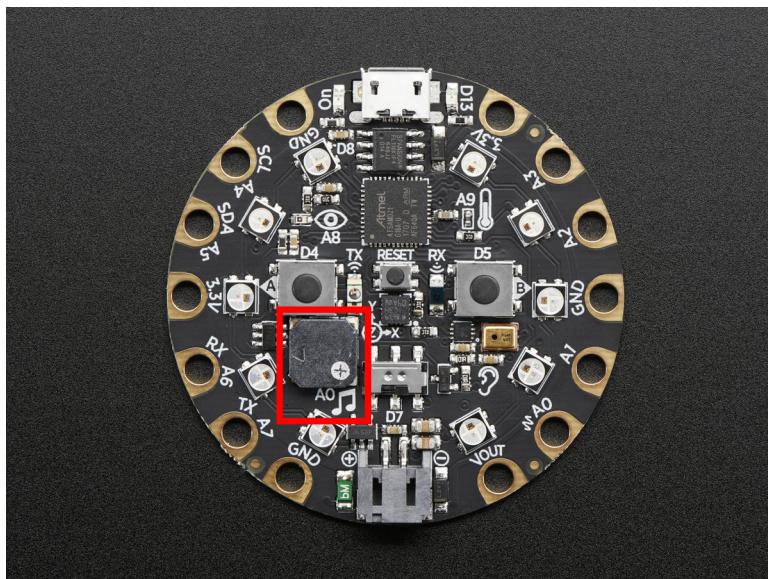

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.button_a:
        cpx.start_tone(262)
    elif cpx.button_b:
        cpx.start_tone(294)
    else:
        cpx.stop_tone()
```

### **stop\_tone()**

Use with start\_tone to stop the tone produced.

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.button_a:
```

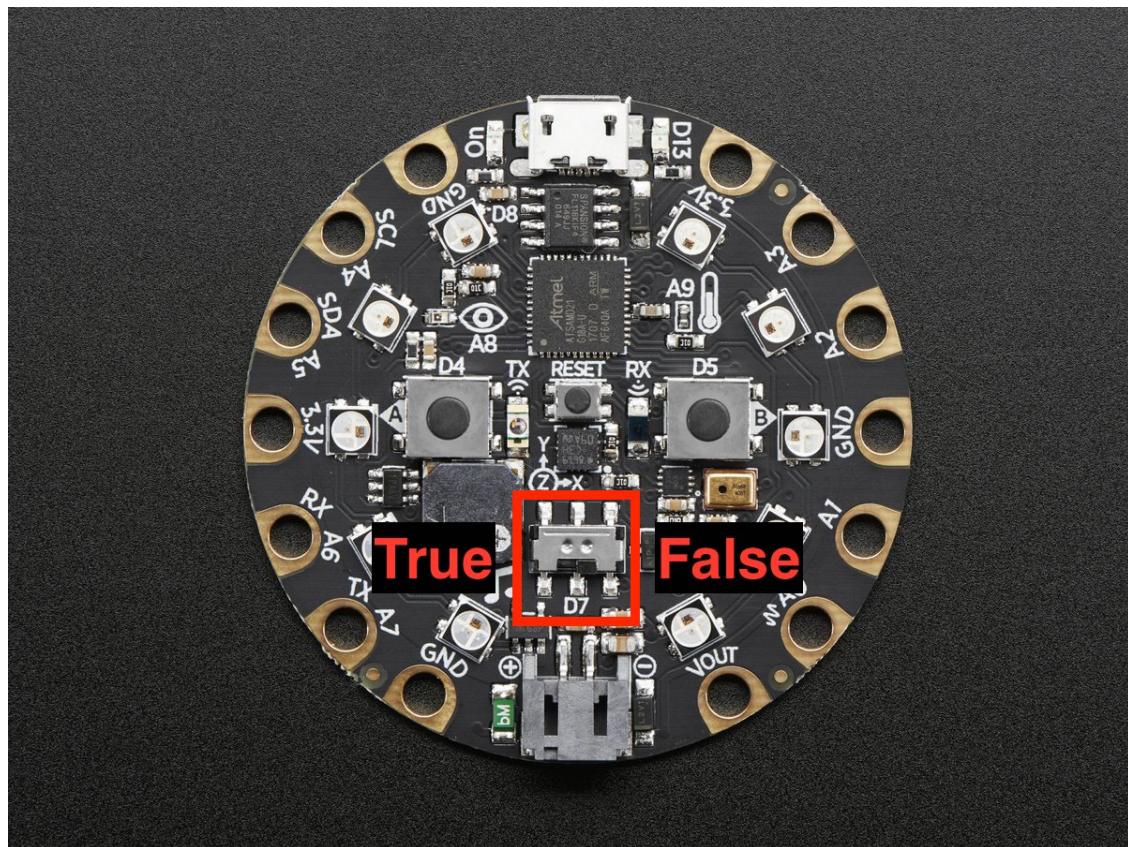

(continues on next page)

(continued from previous page)

```
cpx.start_tone(262)
elif cpx.button_b:
    cpx.start_tone(294)
else:
    cpx.stop_tone()
```

**switch**

True when the switch is to the left next to the music notes. False when it is to the right towards the ear.

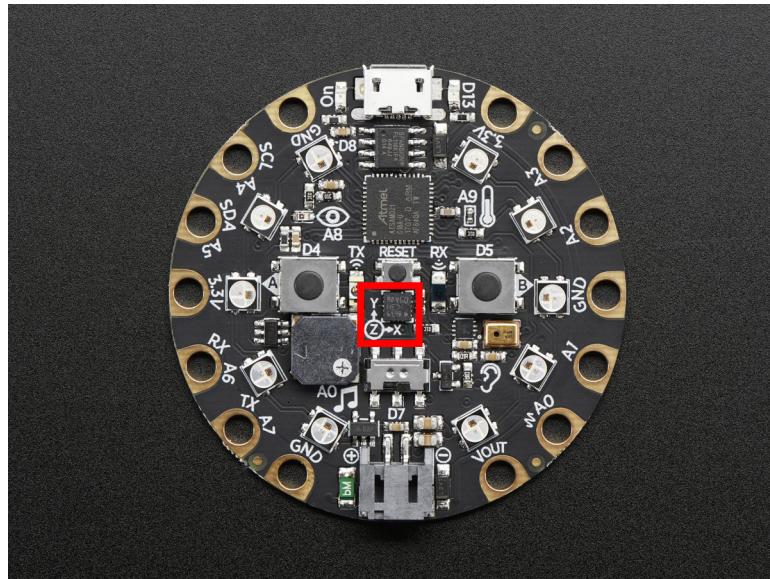

```
from adafruit_circuitplayground.express import cpx
import time

while True:
    print("Slide switch:", cpx.switch)
    time.sleep(1)
```

**tapped**

True once after a detecting a tap. Requires `cpx.detect_taps`.

Tap the CPX once for a single-tap, or quickly tap twice for a double-tap.

```
from adafruit_circuitplayground.express import cpx

cpx.detect_taps = 1

while True:
    if cpx.tapped:
        print("Single tap detected!")
```

To use single and double tap together, you must have a delay between them. It will not function properly without it. This example uses both by counting a specified number of each type of tap before moving on in the code.

```
from adafruit_circuitplayground.express import cpx

# Set to check for single-taps.
cpx.detect_taps = 1
tap_count = 0

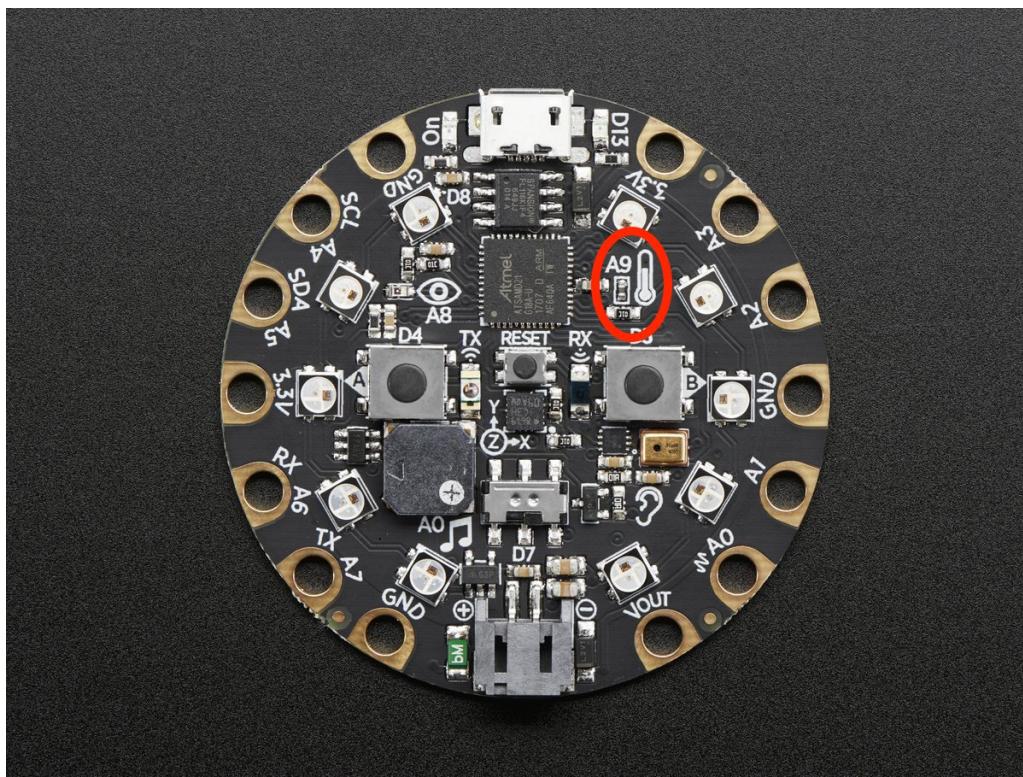

# We're looking for 2 single-taps before moving on.
while tap_count < 2:
    if cpx.tapped:
        tap_count += 1
print("Reached 2 single-taps!")

# Now switch to checking for double-taps
tap_count = 0
cpx.detect_taps = 2

# We're looking for 2 double-taps before moving on.
while tap_count < 2:
    if cpx.tapped:
        tap_count += 1
print("Reached 2 double-taps!")
print("Done.")
```

**temperature**

The temperature of the CircuitPlayground in Celsius.

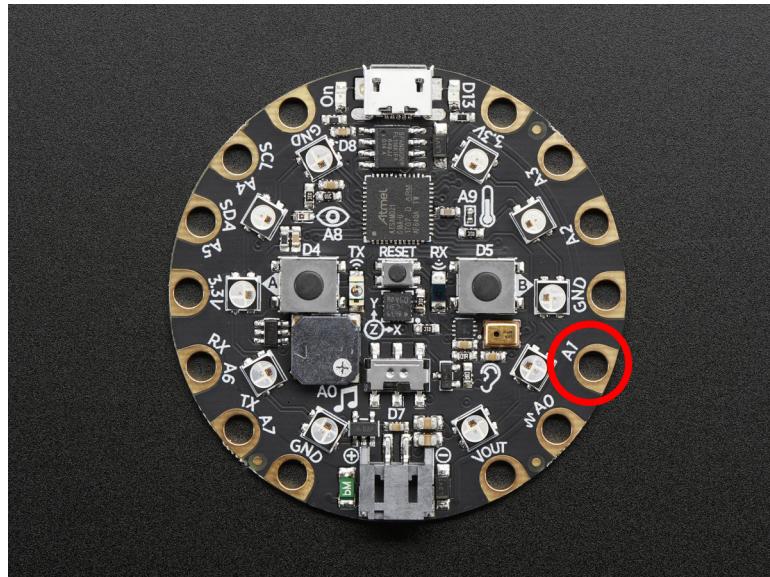

Converting this to Fahrenheit is easy!

```
from adafruit_circuitplayground.express import cpx
import time

while True:
    temperature_c = cpx.temperature
    temperature_f = temperature_c * 1.8 + 32
    print("Temperature celsius:", temperature_c)
    print("Temperature fahrenheit:", temperature_f)
    time.sleep(1)
```

#### touch\_A1

Detect touch on capacitive touch pad A1.

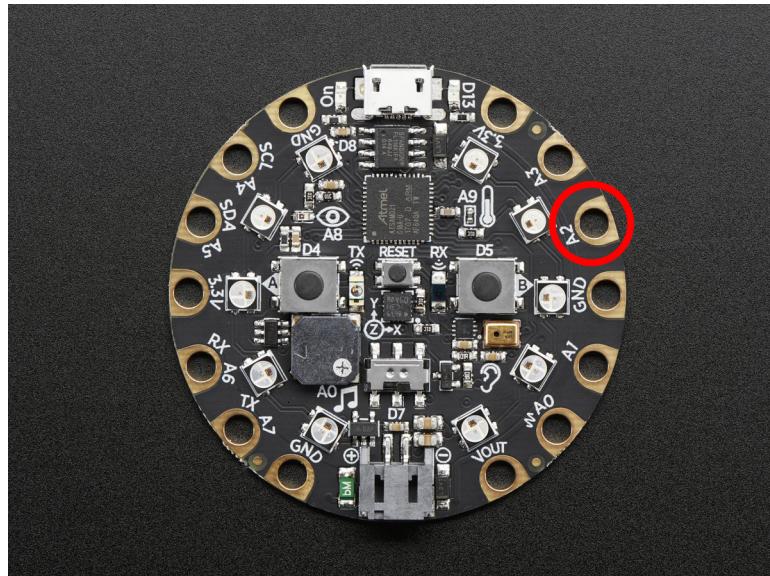

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.touch_A1:
        print('Touched pad A1')
```

### **touch\_A2**

Detect touch on capacitive touch pad A2.

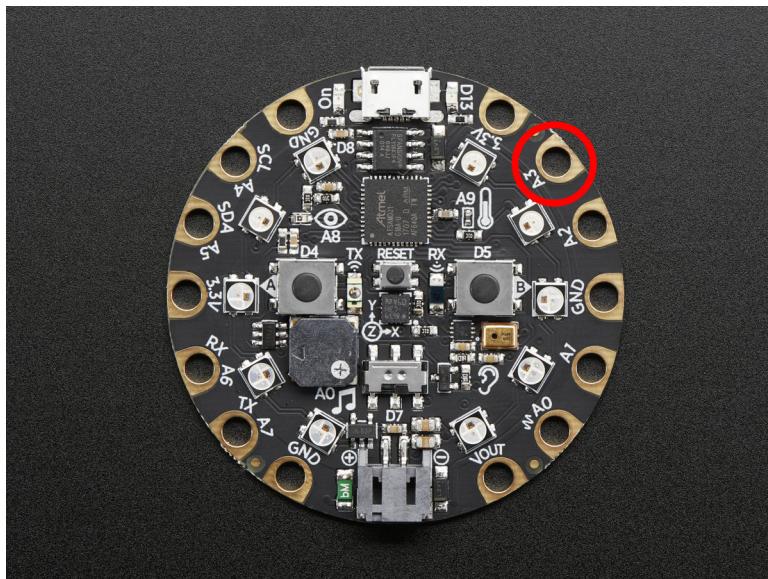

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.touch_A2:
        print('Touched pad A2')
```

### **touch\_A3**

Detect touch on capacitive touch pad A3.

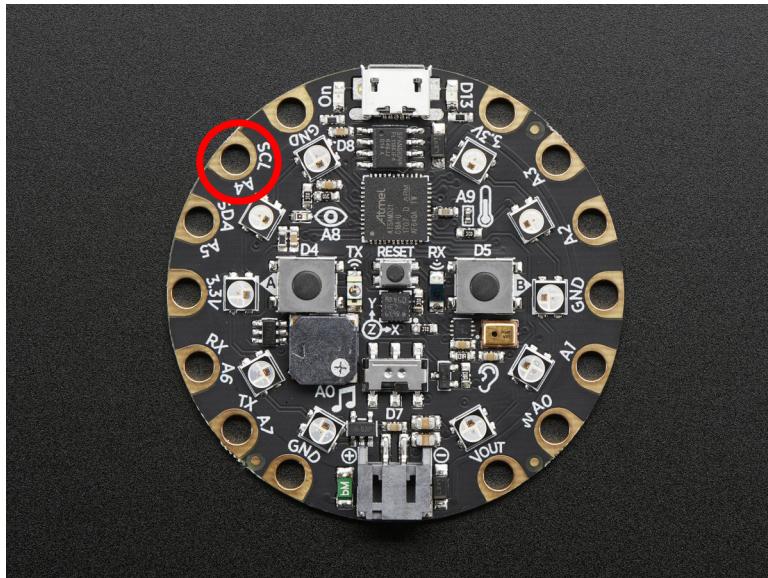

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.touch_A3:
        print('Touched pad A3')
```

### **touch\_A4**

Detect touch on capacitive touch pad A4.

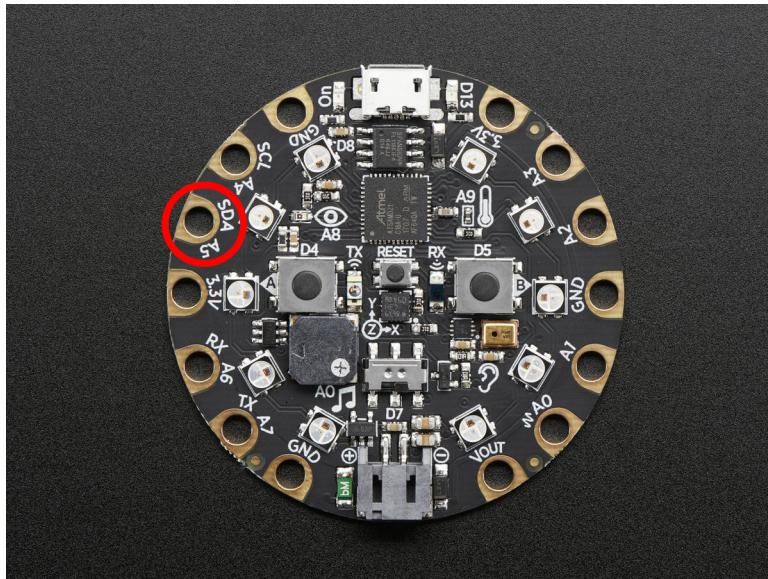

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.touch_A4:
        print('Touched pad A4')
```

### **touch\_A5**

Detect touch on capacitive touch pad A5.

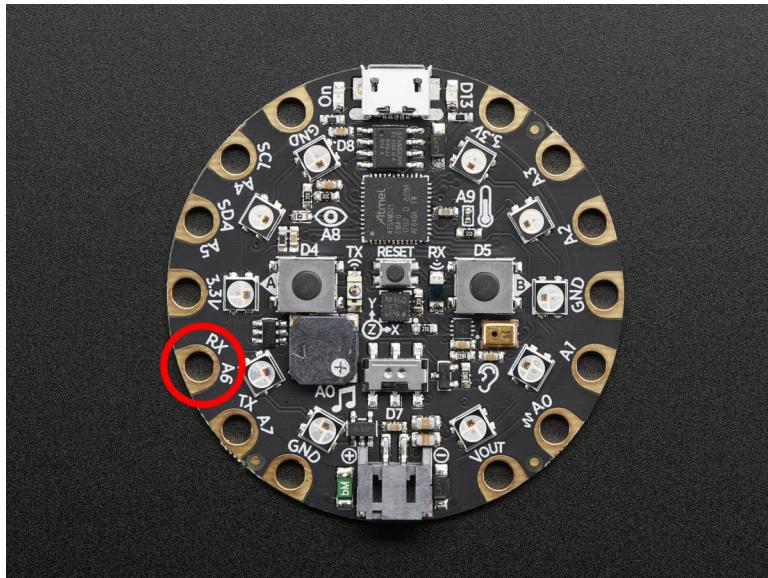

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.touch_A5:
        print('Touched pad A5')
```

### **touch\_A6**

Detect touch on capacitive touch pad A6.

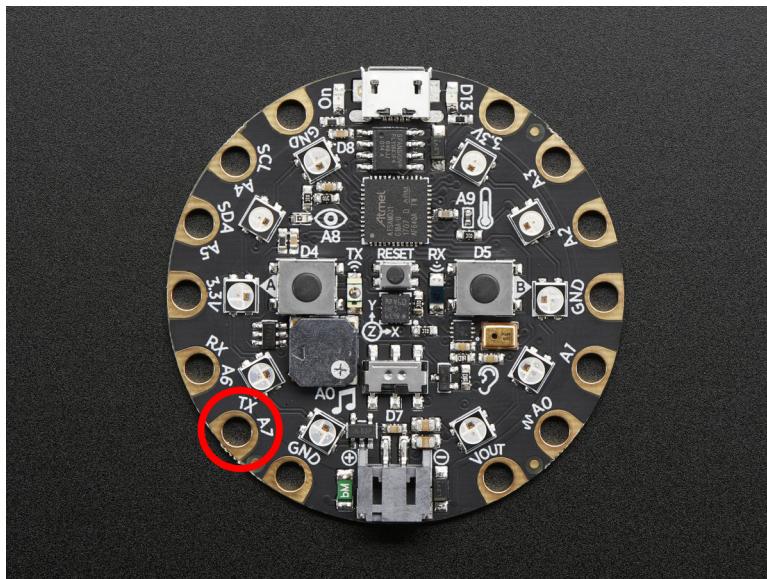

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.touch_A6:
        print('Touched pad A6')
```

### **touch\_A7**

Detect touch on capacitive touch pad A7.

```
from adafruit_circuitplayground.express import cpx

while True:
    if cpx.touch_A7:
        print('Touched pad A7')
```

**class** adafruit\_circuitplayground.express.**Photocell**(*pin*)  
Simple driver for analog photocell on the CircuitPlayground Express.

**light**  
Light level in SI Lux.

adafruit\_circuitplayground.express.**cpx** = <adafruit\_circuitplayground.express.Express object>  
Object that is automatically created on import.

To use, simply import it from the module:

```
from adafruit_circuitplayground.express import cpx
```
