6.3.1	Implementation Notes	46
6.4	<code>adafruit_circuitplayground.express</code>	48
7	Indices and tables	51
	Python Module Index	53
	Index	55

This high level library provides objects that represent Circuit Playground Express and Bluefruit hardware.

CHAPTER 1

Installation

For Circuit Playground Express, simply install CircuitPython to use this library - the library itself and all of its dependencies are built into CircuitPython for Circuit Playground Express.

For Circuit Playground Bluefruit, you must install this library and all of its dependencies. Please download [the latest Adafruit CircuitPython library bundle](#). Open the resulting zip file, open the lib folder within, and copy the following folders and files to the lib folder on your CIRCUITPY drive:

- adafruit_bus_device/
- adafruit_circuitplayground/
- adafruit_lis3dh.mpy
- adafruit_thermistor.mpy
- neopixel.mpy

CHAPTER 2

Usage Example

Using this library is super simple. Simply import the `cp` variable from the module and then use it.

```
from adafruit_circuitplayground import cp

while True:
    if cp.button_a:
        print("Temperature:", cp.temperature)
    cp.red_led = cp.button_b
```

To learn more about all the features of this library, check out the [CircuitPython Made Easy on Circuit Playground Express and Bluefruit guide](#) on the Adafruit Learn System.

CHAPTER 3

Circuit Playground Library Details

For a detailed explanation of how the Circuit Playground library functions, see [The Technical Side](#) page of the CircuitPython Made Easy on Circuit Playground Express and Bluefruit guide.

CHAPTER 4

Contributing

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

CHAPTER 5

Documentation

For information on building library documentation, please check out [this guide](#).

6.1 Simple test

Ensure your device works with this simple test.

Listing 1: examples/circuitplayground_acceleration.py

```
1  """
2  This example uses the accelerometer on the Circuit Playground. It prints the values.
3  ↳ Try moving
4  the board to see the values change. If you're using Mu, open the plotter to see the
5  ↳ values plotted.
6  """

6.2 adafruit_circuitplayground.circuit_playground_base

CircuitPython base class for Circuit Playground.

- [Circuit Playground Express](#)
- [Circuit Playground Bluefruit](#).
- Author(s): Kattni Rembor, Scott Shawcroft

class adafruit_circuitplayground.circuit_playground_base.**CircuitPlaygroundBase**
Circuit Playground base class.

acceleration

Obtain data from the x, y and z axes.

This example prints the values. Try moving the board to see how the printed values change.

To use with the Circuit Playground Express or Bluefruit:

```

from adafruit_circuitplayground import cp

while True:
    x, y, z = cp.acceleration
    print(x, y, z)

```

adjust_touch_threshold (*adjustment*)

Adjust the threshold needed to activate the capacitive touch pads. Higher numbers make the touch pads less sensitive.

Parameters **adjustment** (*int*) – The desired threshold increase

To use with the Circuit Playground Express or Bluefruit:

```

from adafruit_circuitplayground import cp

cp.adjust_touch_threshold(200)

while True:
    if cp.touch_A1:
        print('Touched pad A1')

```

button_a

True when Button A is pressed. False if not.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.button_a:
        print("Button A pressed!")
```

button_b

True when Button B is pressed. False if not.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.button_b:
        print("Button B pressed!")
```

detect_taps

Configure what type of tap is detected by `cp.tapped`. Use 1 for single-tap detection and 2 for double-tap detection. This does nothing without `cp.tapped`.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

cp.detect_taps = 1
while True:
    if cp.tapped:
        print("Single tap detected!")
```

light

The light level.

Try covering the sensor next to the eye to see it change.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp
import time

while True:
    print("Light:", cp.light)
    time.sleep(1)
```

pixels

Sequence-like object representing the ten NeoPixels around the outside of the Circuit Playground. Each pixel is at a certain index in the sequence as labeled below. Colors can be RGB hex like 0x110000 for red where each two digits are a color (0xRRGGBB) or a tuple like (17, 0, 0) where (R, G, B). Set the global brightness using any number from 0 to 1 to represent a percentage, i.e. 0.3 sets global brightness to 30%.

See `neopixel.NeoPixel` for more info.

Here is an example that sets the first pixel green and the ninth red.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

cp.pixels.brightness = 0.3
cp.pixels[0] = 0x00FF00
cp.pixels[9] = (255, 0, 0)
```

play_file(*file_name*)

Play a .wav file using the onboard speaker.

Parameters *file_name* – The name of your .wav file in quotation marks including .wav

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.button_a:
        cp.play_file("laugh.wav")
    elif cp.button_b:
        cp.play_file("rimshot.wav")
```

play_tone (*frequency*, *duration*)

Produce a tone using the speaker. Try changing frequency to change the pitch of the tone.

Parameters

- **frequency** (*int*) – The frequency of the tone in Hz
- **duration** (*float*) – The duration of the tone in seconds

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

cp.play_tone(440, 1)
```

red_led

The red led next to the USB plug marked D13.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp
import time

while True:
    cp.red_led = True
    time.sleep(0.5)
    cp.red_led = False
    time.sleep(0.5)
```

shake (shake_threshold=30)

Detect when device is shaken.

Parameters `shake_threshold` (*int*) – The threshold shake must exceed to return true (Default: 30)

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.shake():
        print("Shake detected!")
```

Decreasing `shake_threshold` increases shake sensitivity, i.e. the code will return a shake detected more easily with a lower `shake_threshold`. Increasing it causes the opposite. `shake_threshold` requires a minimum value of 10 - 10 is the value when the board is not moving, therefore anything less than 10 will erroneously report a constant shake detected.

```
from adafruit_circuitplayground import cp

while True:
    if cp.shake(shake_threshold=20):
        print("Shake detected more easily than before!")
```

start_tone (*frequency*)

Produce a tone using the speaker. Try changing frequency to change the pitch of the tone.

Parameters **frequency** (*int*) – The frequency of the tone in Hz

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.button_a:
        cp.start_tone(262)
    elif cp.button_b:
        cp.start_tone(294)
    else:
        cp.stop_tone()
```

stop_tone()

Use with start_tone to stop the tone produced.

To use with the Circuit Playground Express or Bluefruit:

```

from adafruit_circuitplayground import cp

while True:
    if cp.button_a:
        cp.start_tone(262)
    elif cp.button_b:
        cp.start_tone(294)
    else:
        cp.stop_tone()

```

switch

True when the switch is to the left next to the music notes. False when it is to the right towards the ear.

To use with the Circuit Playground Express or Bluefruit:

```

from adafruit_circuitplayground import cp
import time

while True:
    print("Slide switch:", cp.switch)
    time.sleep(0.1)

```

tapped

True once after detecting a tap. Requires `cp.detect_taps`.

Tap the Circuit Playground once for a single-tap, or quickly tap twice for a double-tap.

To use with Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

cp.detect_taps = 1

while True:
    if cp.tapped:
        print("Single tap detected!")
```

To use single and double tap together, you must have a delay between them. It will not function properly without it. This example uses both by counting a specified number of each type of tap before moving on in the code.

```
from adafruit_circuitplayground import cp

# Set to check for single-taps.
cp.detect_taps = 1
tap_count = 0

# We're looking for 2 single-taps before moving on.
while tap_count < 2:
    if cp.tapped:
        tap_count += 1
print("Reached 2 single-taps!")

# Now switch to checking for double-taps
tap_count = 0
cp.detect_taps = 2

# We're looking for 2 double-taps before moving on.
while tap_count < 2:
    if cp.tapped:
        tap_count += 1
print("Reached 2 double-taps!")
print("Done.")
```

`temperature`

The temperature in Celsius.

Converting this to Fahrenheit is easy!

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp
import time

while True:
    temperature_c = cp.temperature
    temperature_f = temperature_c * 1.8 + 32
    print("Temperature celsius:", temperature_c)
    print("Temperature fahrenheit:", temperature_f)
    time.sleep(1)
```

`touch_A1`

Detect touch on capacitive touch pad A1.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.touch_A1:
        print('Touched pad A1')
```

touch_A2

Detect touch on capacitive touch pad A2.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.touch_A2:
        print('Touched pad A2')
```

touch_A3

Detect touch on capacitive touch pad A3.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.touch_A3:
        print('Touched pad A3')
```

touch_A4

Detect touch on capacitive touch pad A4.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp
```

(continues on next page)

```
while True:
    if cp.touch_A4:
        print('Touched pad A4')
```

Detect touch on capacitive touch pad A5.

A circular black PCB with various electronic components. A red circle highlights a pin labeled 'SDA' and '7.5'. Other components include a USB Type-C port, a microcontroller, various resistors, capacitors, and several push buttons labeled with letters like 'A', 'B', 'C', 'D', 'E', 'F', 'G', 'H', 'I', 'J', 'K', 'L', 'M', 'N', 'O', 'P', 'Q', 'R', 'S', 'T', 'U', 'V', 'W', 'X', 'Y', 'Z'. There are also labels for 'GND', 'VCC', 'TX', 'RX', 'SCL', 'SDA', 'A0', 'A1', 'A2', 'A3', 'A4', 'A5', 'A6', 'A7', 'A8', 'A9', 'A10', 'A11', 'A12', 'A13', 'A14', 'A15', 'A16', 'A17', 'A18', 'A19', 'A20', 'A21', 'A22', 'A23', 'A24', 'A25', 'A26', 'A27', 'A28', 'A29', 'A30', 'A31', 'A32', 'A33', 'A34', 'A35', 'A36', 'A37', 'A38', 'A39', 'A40', 'A41', 'A42', 'A43', 'A44', 'A45', 'A46', 'A47', 'A48', 'A49', 'A50', 'A51', 'A52', 'A53', 'A54', 'A55', 'A56', 'A57', 'A58', 'A59', 'A60', 'A61', 'A62', 'A63', 'A64', 'A65', 'A66', 'A67', 'A68', 'A69', 'A70', 'A71', 'A72', 'A73', 'A74', 'A75', 'A76', 'A77', 'A78', 'A79', 'A80', 'A81', 'A82', 'A83', 'A84', 'A85', 'A86', 'A87', 'A88', 'A89', 'A90', 'A91', 'A92', 'A93', 'A94', 'A95', 'A96', 'A97', 'A98', 'A99', 'A100'.

```
from adafruit_circuitplayground import cp

while True:
    if cp.touch_A5:
        print('Touched pad A5')
```

Detect touch on capacitive touch pad A6.

6.2. adafruit_circuitplayground.circuit_playground_base

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.touch_A6:
        print('Touched pad A6')
```

touch_TX

Detect touch on capacitive touch pad TX (also known as A7 on the Circuit Playground Express) Note: can be called as touch_A7 on Circuit Playground Express.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
```

(continues on next page)

(continued from previous page)

```
if cp.touch_A7:
    print('Touched pad A7')
```

were_pressed

Returns a set of the buttons that have been pressed

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    print(cp.were_pressed)
```

class `adafruit_circuitplayground.circuit_playground_base.Photocell` (*pin*)

Simple driver for analog photocell on the Circuit Playground Express and Bluefruit.

light

Light level.

6.3 `adafruit_circuitplayground.bluefruit`

CircuitPython helper for Circuit Playground Bluefruit.

- Author(s): Kattni Rembor

6.3.1 Implementation Notes

Hardware:

- Circuit Playground Bluefruit

class adafruit_circuitplayground.bluefruit.**Bluefruit**

Represents a single CircuitPlayground Bluefruit.

loud_sound (*sound_threshold=200*)

Utilise a loud sound as an input.

Parameters **sound_threshold** (*int*) – Threshold sound level must exceed to return true (Default: 200)

This example turns the LEDs red each time you make a loud sound. Try clapping or blowing onto the microphone to trigger it.

```
from adafruit_circuitplayground.bluefruit import cpb

while True:
    if cpb.loud_sound():
        cpb.pixels.fill((50, 0, 0))
    else:
        cpb.pixels.fill(0)
```

You may find that the code is not responding how you would like. If this is the case, you can change the loud sound threshold to make it more or less responsive. Setting it to a higher number means it will take a louder sound to trigger. Setting it to a lower number will take a quieter sound to trigger. The following example shows the threshold being set to a higher number than the default.

```
from adafruit_circuitplayground.bluefruit import cpb

while True:
    if cpb.loud_sound(sound_threshold=300):
        cpb.pixels.fill((50, 0, 0))
    else:
        cpb.pixels.fill(0)
```

play_mp3 (*file_name*)

Play a .mp3 file using the onboard speaker.

Parameters *file_name* – The name of your .mp3 file in quotation marks including .mp3

To use with the Circuit Playground Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.button_a:
        cp.play_mp3("laugh.mp3")
    elif cp.button_b:
        cp.play_mp3("rimshot.mp3")
```

sound_level

Obtain the sound level from the microphone (sound sensor).

This example prints the sound levels. Try clapping or blowing on the microphone to see the levels change.

```
from adafruit_circuitplayground.bluefruit import cpb

while True:
    print(cpb.sound_level)
```

`adafruit_circuitplayground.bluefruit.cpb = <adafruit_circuitplayground.bluefruit.Bluefruit>`
Object that is automatically created on import.

To use, simply import it from the module:

```
from adafruit_circuitplayground.bluefruit import cpb
```

6.4 adafruit_circuitplayground.express

CircuitPython helper for Circuit Playground Express.

Hardware:

- Circuit Playground Express
- Author(s): Kattni Rembor, Scott Shawcroft

class `adafruit_circuitplayground.express.Express`

Represents a single CircuitPlayground Express. Do not use more than one at a time.

`loud_sound`

This feature is not supported on Circuit Playground Express.

`play_mp3`

This feature is not supported on Circuit Playground Express.

`sound_level`

This feature is not supported on Circuit Playground Express.

`touch_A7`

Detect touch on capacitive touch pad TX (also known as A7 on the Circuit Playground Express) Note: can be called as `touch_A7` on Circuit Playground Express.

To use with the Circuit Playground Express or Bluefruit:

```
from adafruit_circuitplayground import cp

while True:
    if cp.touch_A7:
        print('Touched pad A7')
```

`adafruit_circuitplayground.express.cpx` = `<adafruit_circuitplayground.express.Express object>`
Object that is automatically created on import.

To use, simply import it from the module:

```
from adafruit_circuitplayground.express import cpx
```
