FancyLED is a CircuitPython library to assist in creating buttery smooth LED animation. It's loosely inspired by the FastLED library for Arduino, and in fact we have a "helper" library using similar function names to assist with porting of existing Arduino FastLED projects to CircuitPython.

CHAPTER 1

Dependencies

This driver depends on:

- [Adafruit CircuitPython](#)

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the [Adafruit library and driver bundle](#).

CHAPTER 2

Installing from PyPI

On supported GNU/Linux systems like the Raspberry Pi, you can install the driver locally [from PyPI](#). To install for current user:

```
pip3 install adafruit-circuitpython-fancyled
```

To install system-wide (this may be required in some cases):

```
sudo pip3 install adafruit-circuitpython-fancyled
```

To install in a virtual environment in your current project:

```
mkdir project-name && cd project-name
python3 -m venv .env
source .env/bin/activate
pip3 install adafruit-circuitpython-fancyled
```

CHAPTER 3

Usage Example

See the examples in the `examples/` folder.

CHAPTER 4

Contributing

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

CHAPTER 5

Documentation

For information on building library documentation, please check out [this guide](#).

6.1 Simple test

Ensure your device works with this simple test.

6.2 adafruit_fancyled.adafruit_fancyled

FancyLED is a CircuitPython library to assist in creating buttery smooth LED animation. It's loosely inspired by the FastLED library for Arduino, and in fact we have a “helper” library using similar function names to assist with porting of existing Arduino FastLED projects to CircuitPython.

- Author(s): PaintYourDragon

class `adafruit_fancyled.adafruit_fancyled.CHSV` (*h, s=1.0, v=1.0*)

Color stored in Hue, Saturation, Value color space.

Accepts hue as float (any range) or integer (0-256 -> 0.0-1.0) with no clamping performed (hue can ‘wrap around’), saturation and value as float (0.0 to 1.0) or integer (0 to 255), both are clamped and stored internally in the normalized (float) format. Latter two are optional, can pass just hue and saturation/value will default to 1.0.

Unlike `CRGB` (which can take a `CHSV` as input), there's currently no equivalent RGB-to-HSV conversion, mostly because it's a bit like trying to reverse a hash... there may be multiple HSV solutions for a given RGB input.

This might be OK as long as conversion precedence is documented, but otherwise (and maybe still) could cause confusion as certain HSV->RGB->HSV translations won't have the same input and output.

pack()

'Pack' a *CHSV* color into a 24-bit RGB integer.

Returns 24-bit integer a la 0x00RRGGBB.

class adafruit_fancyled.adafruit_fancyled.**CRGB**(red, green=0.0, blue=0.0)

Color stored in Red, Green, Blue color space.

One of two ways: separate red, green, blue values (either as integers (0 to 255 range) or floats (0.0 to 1.0 range), either type is 'clamped' to valid range and stored internally in the normalized (float) format), OR can accept a CHSV color as input, which will be converted and stored in RGB format.

Following statements are equivalent - all return red:

```
c = CRGB(255, 0, 0)
c = CRGB(1.0, 0.0, 0.0)
c = CRGB(CHSV(0.0, 1.0, 1.0))
```

pack()

'Pack' a *CRGB* color into a 24-bit RGB integer.

Returns 24-bit integer a la 0x00RRGGBB.

adafruit_fancyled.adafruit_fancyled.**clamp**(val, lower, upper)

Constrain value within a numeric range (inclusive).

adafruit_fancyled.adafruit_fancyled.**denormalize**(val, inplace=False)

Convert normalized (0.0 to 1.0) value to 8-bit (0 to 255) value

Accepts float, 0.0 to 1.0 range or a list or tuple of floats. In list case, 'inplace' can be used to control whether the original list is modified (True) or a new list is generated and returned (False).

Returns integer, 0 to 255 range, or list of integers (or None if inplace).

adafruit_fancyled.adafruit_fancyled.**expand_gradient**(gradient, length)

Convert gradient palette into standard equal-interval palette.

Parameters **gradient** (*sequence*) – List or tuple of 2-element lists/tuples containing position (0.0 to 1.0) and color (packed int, CRGB or CHSV). It's OK if the list/tuple elements are either lists OR tuples, but don't mix and match lists and tuples – use all one or the other.

Returns CRGB list, can be used with palette_lookup() function.

adafruit_fancyled.adafruit_fancyled.**gamma_adjust**(val, gamma_value=None, brightness=1.0, inplace=False)

Provides gamma adjustment for single values, *CRGB* and *CHSV* types and lists of any of these.

Works in one of three ways:

1. Accepts a single normalized level (0.0 to 1.0) and optional gamma-adjustment factor (float usu. > 1.0, default if unspecified is GFACITOR) and brightness (float 0.0 to 1.0, default is 1.0). Returns a single normalized gamma-corrected brightness level (0.0 to 1.0).
2. Accepts a single *CRGB* or *CHSV* type, optional single gamma factor OR a (R,G,B) gamma tuple (3 values usu. > 1.0), optional single brightness factor OR a (R,G,B) brightness tuple. The input tuples are RGB even when a *CHSV* color is passed. Returns a normalized gamma-corrected *CRGB* type (NOT *CHSV*!).
3. Accept a list or tuple of normalized levels, *CRGB* or *CHSV* types (and optional gamma and brightness levels or tuples applied to all). Returns a list of gamma-corrected values or *CRGB* types (NOT *CHSV*!).

In cases 2 and 3, if the input is a list (NOT a tuple!), the ‘inplace’ flag determines whether a new tuple/list is calculated and returned, or the existing value is modified in-place. By default this is ‘False’. If you try to inplace-modify a tuple, an exception is raised.

In cases 2 and 3, there is NO return value if ‘inplace’ is True – the original values are modified.

`adafruit_fancyled.adafruit_fancyled.mix(color1, color2, weight2=0.5)`

Blend between two colors using given ratio. Accepts two colors (each may be *CRGB*, *CHSV* or packed integer), and weighting (0.0 to 1.0) of second color.

Returns *CRGB* color in most cases, *CHSV* if both inputs are *CHSV*.

`adafruit_fancyled.adafruit_fancyled.normalize(val, inplace=False)`

Convert 8-bit (0 to 255) value to normalized (0.0 to 1.0) value.

Accepts integer, 0 to 255 range (input is clamped) or a list or tuple of integers. In list case, ‘inplace’ can be used to control whether the original list is modified (True) or a new list is generated and returned (False).

Returns float, 0.0 to 1.0 range, or list of floats (or None if inplace).

`adafruit_fancyled.adafruit_fancyled.palette_lookup(palette, position)`

Fetch color from color palette, with interpolation.

Parameters

- **palette** – color palette (list of *CRGB*, *CHSV* and/or packed integers)
- **position** (*float*) – palette position (0.0 to 1.0, wraps around).

Returns *CRGB* or *CHSV* instance, no gamma correction applied.

`adafruit_fancyled.adafruit_fancyled.unpack(val)`

‘Unpack’ a 24-bit color into a *CRGB* instance.

Parameters **val** (*int*) – 24-bit integer a la 0x00RRGGBB.

Returns *CRGB* color.

Return type *CRGB*

6.3 adafruit_fancyled.fastled_helpers

CircuitPython “helper” library based on the Arduino FastLED library. Uses similar function names to assist with porting of existing Arduino FastLED projects to CircuitPython.

- Author(s): PaintYourDragon

`adafruit_fancyled.fastled_helpers.ColorFromPalette(pal, pos, brightness=255, blend=False)`

Approximates the FastLED ColorFromPalette() function

ACCEPTS: color palette (list of *CRGB*, *CHSV* and/or packed ints), palette index (x16) + blend factor of next index (0-15) – e.g. pass 32 to retrieve palette index 2, or 40 for an interpolated value between palette index 2 and 3, optional brightness (0-255), optional blend flag (True/False)

RETURNS: *CRGB* color, no gamma correction

`adafruit_fancyled.fastled_helpers.applyGamma_video(n, g_r=2.5, g_g=None, g_b=None, inplace=False)`

Approximates various invocations of FastLED’s many-ways-overloaded applyGamma_video() function.

ACCEPTS: One of three ways:

1. A single brightness level (0-255) and optional gamma-correction factor (float usu. > 1.0, default if unspecified is 2.5).
2. A single CRGB, CHSV or packed integer type and optional gamma factor or separate R, G, B gamma values.
3. A list of CRGB, CHSV or packed integer types (and optional gamma(s)).

In the tuple/list cases, the ‘inplace’ flag determines whether a new tuple/list is calculated and returned, or the existing value is modified in-place. By default this is ‘False’. Can also use the `napplyGamma_video()` function to more directly approximate FastLED syntax/behavior.

RETURNS: Corresponding to above cases:

1. Single gamma-corrected brightness level (0-255).
2. A gamma-corrected CRGB value (even if input is CHSV or packed).
3. A list of gamma-corrected CRGB values.

In the tuple/list cases, there is NO return value if ‘inplace’ is true – the original values are modified.

`adafruit_fancyLED.fastLED_helpers.hsv2rgb_spectrum(hue, sat, val)`

This is named the same thing as FastLED’s simpler HSV to RGB function (spectrum, vs rainbow) but implementation is a bit different for the sake of getting something running (adapted from some NeoPixel code).

ACCEPTS: hue, saturation, value in range 0 to 255 RETURNS: CRGB color.

`adafruit_fancyLED.fastLED_helpers.loadDynamicGradientPalette(src, size)`

Kindasorta like FastLED’s `loadDynamicGradientPalette()` function, with some gotchas.

ACCEPTS: Gradient palette data as a ‘bytes’ type (makes it easier to copy over gradient palettes from existing FastLED Arduino sketches)... each palette entry is four bytes: a relative position (0-255) within the overall resulting palette (whatever its size), and 3 values for R, G and B... and a length for a new palette list to be allocated.

RETURNS: list of CRGB colors.

`adafruit_fancyLED.fastLED_helpers.napplyGamma_video(n, g_r=2.5, g_g=None, g_b=None)`

In-place version of `applyGamma_video()` (to mimic FastLED function name). This is for RGB tuples and tuple lists (not the prior function’s integer case)
