GPS parsing module. Can parse simple NMEA data sentences from serial GPS modules to read latitude, longitude, and more.

CHAPTER 1

Dependencies

This driver depends on:

- [Adafruit CircuitPython](#)

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the [Adafruit library and driver bundle](#).

CHAPTER 2

Installing from PyPI

On supported GNU/Linux systems like the Raspberry Pi, you can install the driver locally [from PyPI](#). To install for current user:

```
pip3 install adafruit-circuitpython-gps
```

To install system-wide (this may be required in some cases):

```
sudo pip3 install adafruit-circuitpython-gps
```

To install in a virtual environment in your current project:

```
mkdir project-name && cd project-name
python3 -m venv .env
source .env/bin/activate
pip3 install adafruit-circuitpython-gps
```

CHAPTER 3

Usage Example

See `examples/gps_simpletest.py` for a demonstration of parsing and printing GPS location.

Important: Feather boards and many other circuitpython boards will round to two decimal places like this:

```
>>> float('1234.5678')
1234.57
```

This isn't ideal for GPS data as this lowers the accuracy from 0.1m to 11m.

This can be fixed by using string formatting when the GPS data is output.

An implementation of this can be found in `examples/gps_simpletest.py`

```
import time
import board
import busio

import adafruit_gps

RX = board.RX
TX = board.TX

uart = busio.UART(TX, RX, baudrate=9600, timeout=30)

gps = adafruit_gps.GPS(uart, debug=False)

gps.send_command(b'PMTK314,0,1,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0')

gps.send_command(b'PMTK220,1000')

last_print = time.monotonic()
while True:

    gps.update()
```

(continues on next page)

(continued from previous page)

```
current = time.monotonic()
if current - last_print >= 1.0:
    last_print = current
    if not gps.has_fix:
        print('Waiting for fix...')
        continue
    print('=' * 40) # Print a separator line.
    print('Latitude: {0:.6f} degrees'.format(gps.latitude))
    print('Longitude: {0:.6f} degrees'.format(gps.longitude))
```

These two lines are the lines that actually solve the issue:

```
print('Latitude: {0:.6f} degrees'.format(gps.latitude))
print('Longitude: {0:.6f} degrees'.format(gps.longitude))
```

Note: Sending multiple PMTK314 packets with `gps.send_command()` will not work unless there is a substantial amount of time in-between each time `gps.send_command()` is called. A `time.sleep()` of 1 second or more should fix this.

CHAPTER 4

About NMEA Data

This GPS module uses the NMEA 0183 protocol.

This data is formatted by the GPS in one of two ways.

The first of these is GGA. GGA has more or less everything you need.

Here's an explanation of GGA:

											11				
1	2	3	4	5	6	7	8	9	10		12	13	14	15	
\$--GGA,hhmmss.ss,llll.ll,a,yyyy.yy,a,x,xx,x.x,x.x,M,x.x,M,x.x,xxxx*hh															

1. Time (UTC)
2. Latitude
3. N or S (North or South)
4. Longitude
5. E or W (East or West)
6. GPS Quality Indicator,
 - 0 - fix not available,
 - 1 - GPS fix,
 - 2 - Differential GPS fix
7. Number of satellites in view, 00 - 12
8. Horizontal Dilution of precision
9. Antenna Altitude above/below mean-sea-level (geoid)
10. Units of antenna altitude, meters
11. Geoidal separation, the difference between the WGS-84 earth ellipsoid and mean-sea-level (geoid), “-” means mean-sea-level below ellipsoid

12. Units of geoidal separation, meters
13. Age of differential GPS data, time in seconds since last SC104 type 1 or 9 update, null field when DGPS is not used
14. Differential reference station ID, 0000-1023
15. Checksum

The second of these is RMC. RMC is Recommended Minimum Navigation Information.

Here's an explanation of RMC:

												12
1	2	3	4	5	6	7	8	9	10	11		
\$--RMC,hhmmss.ss,A,llll.ll,a,yyyy.yy,a,x.x,x.x,xxxx,x.x,a*hh												

1. Time (UTC)
2. Status, V = Navigation receiver warning
3. Latitude
4. N or S
5. Longitude
6. E or W
7. Speed over ground, knots
8. Track made good, degrees true
9. Date, ddmmyy
10. Magnetic Variation, degrees
11. E or W
12. Checksum

[Info about NMEA taken from here.](#)

CHAPTER 5

Contributing

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

CHAPTER 6

Documentation

For information on building library documentation, please check out [this guide](#).

Table of Contents

7.1 Simple test

Ensure your device works with this simple test.

Listing 1: examples/gps_simpletest.py

```
1  # SPDX-FileCopyrightText: 2021 ladyada for Adafruit Industries

3
4  # Simple GPS module demonstration.
5  # Will wait for a fix and print a message every second with the current location
6  # and other details.
7  import time
8  import board
9  import busio
10
11 import adafruit_gps
12
13 # Create a serial connection for the GPS connection using default speed and
14 # a slightly higher timeout (GPS modules typically update once a second).
15 # These are the defaults you should use for the GPS FeatherWing.
16 # For other boards set RX = GPS module TX, and TX = GPS module RX pins.
17 uart = busio.UART(board.TX, board.RX, baudrate=9600, timeout=10)
18
19 # for a computer, use the pyserial library for uart access
20 # import serial
21 # uart = serial.Serial("/dev/ttyUSB0", baudrate=9600, timeout=10)
22
23 # If using I2C, we'll create an I2C interface to talk to using default pins
24 # i2c = board.I2C()
25
26 # Create a GPS module instance.
27 gps = adafruit_gps.GPS(uart, debug=False) # Use UART/pyserial
```

(continues on next page)

(continued from previous page)

```

28 # gps = adafruit_gps.GPS_GtopI2C(i2c, debug=False) # Use I2C interface
29
30 # Initialize the GPS module by changing what data it sends and at what rate.
31 # These are NMEA extensions for PMTK_314_SET_NMEA_OUTPUT and
32 # PMTK_220_SET_NMEA_UPDATERATE but you can send anything from here to adjust
33 # the GPS module behavior:
34 # https://cdn-shop.adafruit.com/datasheets/PMTK\_All.pdf
35
36 # Turn on the basic GGA and RMC info (what you typically want)
37 gps.send_command(b"PMTK314,0,1,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0")
38 # Turn on just minimum info (RMC only, location):
39 # gps.send_command(b'PMTK314,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0')
40 # Turn off everything:
41 # gps.send_command(b'PMTK314,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0')
42 # Turn on everything (not all of it is parsed!)
43 # gps.send_command(b'PMTK314,1,1,1,1,1,0,0,0,0,0,0,0,0,0,0,0,0')
44
45 # Set update rate to once a second (1hz) which is what you typically want.
46 gps.send_command(b"PMTK220,1000")
47 # Or decrease to once every two seconds by doubling the millisecond value.
48 # Be sure to also increase your UART timeout above!
49 # gps.send_command(b'PMTK220,2000')
50 # You can also speed up the rate, but don't go too fast or else you can lose
51 # data during parsing. This would be twice a second (2hz, 500ms delay):
52 # gps.send_command(b'PMTK220,500')
53
54 # Main loop runs forever printing the location, etc. every second.
55 last_print = time.monotonic()
56 while True:
57     # Make sure to call gps.update() every loop iteration and at least twice
58     # as fast as data comes from the GPS unit (usually every second).
59     # This returns a bool that's true if it parsed new data (you can ignore it
60     # though if you don't care and instead look at the has_fix property).
61     gps.update()
62     # Every second print out current location details if there's a fix.
63     current = time.monotonic()
64     if current - last_print >= 1.0:
65         last_print = current
66         if not gps.has_fix:
67             # Try again if we don't have a fix yet.
68             print("Waiting for fix...")
69             continue
70         # We have a fix! (gps.has_fix is true)
71         # Print out details about the fix like location, date, etc.
72         print("=" * 40) # Print a separator line.
73         print(
74             "Fix timestamp: {}/{}/{} {:02}:{:02}:{:02}".format(
75                 gps.timestamp_utc.tm_mon, # Grab parts of the time from the
76                 gps.timestamp_utc.tm_mday, # struct_time object that holds
77                 gps.timestamp_utc.tm_year, # the fix time. Note you might
78                 gps.timestamp_utc.tm_hour, # not get all data like year, day,
79                 gps.timestamp_utc.tm_min, # month!
80                 gps.timestamp_utc.tm_sec,
81             )
82         )
83         print("Latitude: {0:.6f} degrees".format(gps.latitude))
84         print("Longitude: {0:.6f} degrees".format(gps.longitude))

```

(continues on next page)

(continued from previous page)

```

85     print("Fix quality: {}".format(gps.fix_quality))
86     # Some attributes beyond latitude, longitude and timestamp are optional
87     # and might not be present. Check if they're None before trying to use!
88     if gps.satellites is not None:
89         print("# satellites: {}".format(gps.satellites))
90     if gps.altitude_m is not None:
91         print("Altitude: {} meters".format(gps.altitude_m))
92     if gps.speed_knots is not None:
93         print("Speed: {} knots".format(gps.speed_knots))
94     if gps.track_angle_deg is not None:
95         print("Track angle: {} degrees".format(gps.track_angle_deg))
96     if gps.horizontal_dilution is not None:
97         print("Horizontal dilution: {}".format(gps.horizontal_dilution))
98     if gps.height_geoid is not None:
99         print("Height geo ID: {} meters".format(gps.height_geoid))

```

7.2 adafruit_gps

GPS parsing module. Can parse simple NMEA data sentences from serial GPS modules to read latitude, longitude, and more.

- Author(s): Tony DiCola

7.2.1 Implementation Notes

Hardware:

- Adafruit Ultimate GPS Breakout
- Adafruit Ultimate GPS FeatherWing

Software and Dependencies:

- Adafruit CircuitPython firmware for the ESP8622 and M0-based boards: <https://github.com/adafruit/circuitpython/releases>

class `adafruit_gps.GPS(uart, debug=False)`

GPS parsing module. Can parse simple NMEA data sentences from serial GPS modules to read latitude, longitude, and more.

datetime

Return struct_time object to feed rtc.set_time_source() function

has_3d_fix

Returns true if there is a 3d fix available. use has_fix to determine if a 2d fix is available, passing it the same data

has_fix

True if a current fix for location information is available.

in_waiting

Returns number of bytes available in UART read buffer

nmea_sentence

Return raw_sentence which is the raw NMEA sentence read from the GPS

read (*num_bytes*)

Read up to *num_bytes* of data from the GPS directly, without parsing. Returns a bytearray with up to *num_bytes* or None if nothing was read

readline ()

Returns a newline terminated bytearray, must have timeout set for the underlying UART or this will block forever!

send_command (*command*, *add_checksum=True*)

Send a command string to the GPS. If *add_checksum* is True (the default) a NMEA checksum will automatically be computed and added. Note you should NOT add the leading \$ and trailing * to the command as they will automatically be added!

update ()

Check for updated data from the GPS module and process it accordingly. Returns True if new data was processed, and False if nothing new was received.

write (*bytestr*)

Write a bytestring data to the GPS directly, without parsing or checksums

class adafruit_gps.**GPS_GtopI2C** (*i2c_bus*, *, *address=16*, *debug=False*, *timeout=5*)

GTop-compatible I2C GPS parsing module. Can parse simple NMEA data sentences from an I2C-capable GPS module to read latitude, longitude, and more.

in_waiting

Returns number of bytes available in UART read buffer, always 32 since I2C does not have the ability to know how much data is available

read (*num_bytes=1*)

Read up to *num_bytes* of data from the GPS directly, without parsing. Returns a bytearray with up to *num_bytes* or None if nothing was read

readline ()

Returns a newline terminated bytearray, must have timeout set for the underlying UART or this will block forever!

write (*bytestr*)

Write a bytestring data to the GPS directly, without parsing or checksums
