This is a library for using the I²C-based LED matrices with the HT16K33 chip. It supports both 16x8 and 8x8 matrices, as well as 7- and 14-segment displays.

- **Notes**

1. This library is intended for Adafruit CircuitPython's API. For a library compatible with MicroPython machine API see this [library](#).
2. This library does not work with the Trellis 4x4 LED+Keypad board. For that product use: [CircuitPython Trellis Library](#)

CHAPTER 1

Dependencies

This driver depends on:

- Adafruit CircuitPython
- Bus Device

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the [Adafruit library and driver bundle](#).

CHAPTER 2

Usage Example

```
# Import all board pins and bus interface.
import board
import busio

# Import the HT16K33 LED matrix module.
from adafruit_ht16k33 import matrix

# Create the I2C interface.
i2c = busio.I2C(board.SCL, board.SDA)

# Create the matrix class.
# This creates a 16x8 matrix:
matrix = matrix.Matrix16x8(i2c)
# Or this creates a 8x8 matrix:
#matrix = matrix.Matrix8x8(i2c)
# Or this creates a 8x8 bicolor matrix:
#matrix = matrix.Matrix8x8x2
# Finally you can optionally specify a custom I2C address of the HT16k33 like:
#matrix = matrix.Matrix16x8(i2c, address=0x70)

# Clear the matrix.
matrix.fill(0)

# Set a pixel in the origin 0,0 position.
matrix[0, 0] = 1
# Set a pixel in the middle 8, 4 position.
matrix[8, 4] = 1
# Set a pixel in the opposite 15, 7 position.
matrix[15, 7] = 1
matrix.show()

# Change the brightness
matrix.brightness = 8
```

(continues on next page)

(continued from previous page)

```
# Set the blink rate
matrix.blink_rate = 2
```

CHAPTER 3

Contributing

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

CHAPTER 4

Building locally

To build this library locally you'll need to install the `circuitpython-build-tools` package.

```
python3 -m venv .env
source .env/bin/activate
pip install circuitpython-build-tools
```

Once installed, make sure you are in the virtual environment:

```
source .env/bin/activate
```

Then run the build:

```
circuitpython-build-bundles --filename_prefix adafruit-circuitpython-ht16k33 --
˓→library_location .
```

4.1 Sphinx documentation

Sphinx is used to build the documentation based on rST files and comments in the code. First, install dependencies (feel free to reuse the virtual environment from above):

```
python3 -m venv .env
source .env/bin/activate
pip install Sphinx sphinx-rtd-theme
```

Now, once you have the virtual environment activated:

```
cd docs
sphinx-build -E -W -b html . _build/html
```

This will output the documentation to `docs/_build/html`. Open the `index.html` in your browser to view them. It will also (due to `-W`) error out on any warning like Travis will. This is a good way to locally verify it will pass.

CHAPTER 5

Table of Contents

5.1 Simple test

Ensure your device works with this simple test.

Listing 1: examples/ht16k33_matrix_simpletest.py

```
1 # Basic example of clearing and drawing a pixel on a LED matrix display.
2 # This example and library is meant to work with Adafruit CircuitPython API.

5
6 # Import all board pins.
7 import board
8 import busio
9
10 # Import the HT16K33 LED matrix module.
11 from adafruit_ht16k33 import matrix
12
13
14 # Create the I2C interface.
15 i2c = busio.I2C(board.SCL, board.SDA)
16
17 # Create the matrix class.
18 # This creates a 16x8 matrix:
19 matrix = matrix.Matrix16x8(i2c)
20 # Or this creates a 8x8 matrix:
21 #matrix = matrix.Matrix8x8(i2c)
22 # Or this creates a 8x8 bicolor matrix:
23 #matrix = matrix.Matrix8x8x2(i2c)
24 # Finally you can optionally specify a custom I2C address of the HT16k33 like:
25 #matrix = matrix.Matrix16x8(i2c, address=0x70)
26
27 # Clear the matrix.
```

(continues on next page)

(continued from previous page)

```
28 matrix.fill(0)
29
30 # Set a pixel in the origin 0,0 position.
31 matrix[0, 0] = 1
32 # Set a pixel in the middle 8, 4 position.
33 matrix[8, 4] = 1
34 # Set a pixel in the opposite 15, 7 position.
35 matrix[15, 7] = 1
```

Listing 2: examples/ht16k33_segments_simpletest.py

```
1 # Basic example of setting digits on a LED segment display.
2 # This example and library is meant to work with Adafruit CircuitPython API.
3 # Author: Tony DiCola
4 # License: Public Domain
5
6 import time
7
8 # Import all board pins.
9 import board
10 import busio
11
12 # Import the HT16K33 LED segment module.
13 from adafruit_ht16k33 import segments
14
15
16 # Create the I2C interface.
17 i2c = busio.I2C(board.SCL, board.SDA)
18
19 # Create the LED segment class.
20 # This creates a 7 segment 4 character display:
21 display = segments.Seg7x4(i2c)
22 # Or this creates a 14 segment alphanumeric 4 character display:
23 #display = segments.Seg14x4(i2c)
24 # Finally you can optionally specify a custom I2C address of the HT16k33 like:
25 #display = segments.Seg7x4(i2c, address=0x70)
26
27 # Clear the display.
28 display.fill(0)
29
30 # Can just print a number
31 display.print(42)
32 time.sleep(2)
33
34 # Or, can set individual digits / characters
35 # Set the first character to '1':
36 display[0] = '1'
37 # Set the second character to '2':
38 display[1] = '2'
39 # Set the third character to 'A':
40 display[2] = 'A'
41 # Set the forth character to 'B':
42 display[3] = 'B'
```

Listing 3: examples/ht16k33_bicolor24_simpletest.py

```

4 # License: Public Domain
5
6 import time
7
8 # Import board related modules
9 import board
10 import busio
11
12 # Import the Bicolor24 driver from the HT16K33 module
13 from adafruit_ht16k33.bargraph import Bicolor24
14
15 # Create the I2C interface
16 i2c = busio.I2C(board.SCL, board.SDA)
17
18 # Create the LED bargraph class.
19 bc24 = Bicolor24(i2c)
20
21 # Set individual segments of bargraph
22 bc24[0] = bc24.LED_RED
23 bc24[1] = bc24.LED_GREEN
24 bc24[2] = bc24.LED_YELLOW
25
26 time.sleep(2)
27
28 # Turn them all off
29 bc24.fill(bc24.LED_OFF)
30
31 # Turn them on in a loop
32 for i in range(24):
33     bc24[i] = bc24.LED_RED
34     time.sleep(0.1)
35     bc24[i] = bc24.LED_OFF
36
37 time.sleep(1)
38
39 # Fill the entire bargraph
40 bc24.fill(bc24.LED_GREEN)

```

5.2 adafruit_ht16k33.ht16k33

- Authors: Radomir Dopieralski & Tony DiCola for Adafruit Industries

class adafruit_ht16k33.ht16k33.HT16K33(*i2c*, *address*=112, *auto_write*=True)
The base class for all displays. Contains common methods.

Parameters

- **address** (*int*) – The I2C address of the HT16K33.
- **auto_write** (*bool*) – True if the display should immediately change when set. If False, *show* must be called explicitly.

auto_write

Auto write updates to the display.

blink_rate

The blink rate. Range 0-3.

brightness

The brightness. Range 0-15.

fill(color)

Fill the whole display with the given color.

show()

Refresh the display and show the changes.

5.3 Matrix Displays

class adafruit_ht16k33.matrix.**Matrix16x8** (*i2c, address=112, auto_write=True*)

A double matrix or the matrix wing.

pixel(x, y, color=None)

Get or set the color of a given pixel.

class adafruit_ht16k33.matrix.**Matrix8x8** (*i2c, address=112, auto_write=True*)

A single matrix.

pixel(x, y, color=None)

Get or set the color of a given pixel.

class adafruit_ht16k33.matrix.**Matrix8x8x2** (*i2c, address=112, auto_write=True*)

A bi-color matrix.

fill(color)

Fill the whole display with the given color.

pixel(x, y, color=None)

Get or set the color of a given pixel.

5.4 Segment Displays

class adafruit_ht16k33.segments.**BigSeg7x4** (*i2c, address=112, auto_write=True*)

Numeric 7-segment display. It has the same methods as the alphanumeric display, but only supports displaying a limited set of characters.

ampm

The AM/PM indicator.

class adafruit_ht16k33.segments.**Colon** (*disp, num_of_colons=1*)

Helper class for controlling the colons. Not intended for direct use.

class adafruit_ht16k33.segments.**Seg14x4** (*i2c, address=112, auto_write=True*)

Alpha-numeric, 14-segment display.

print(value)

Print the value to the display.

scroll(count=1)

Scroll the display by specified number of places.

class adafruit_ht16k33.segments.**Seg7x4** (*i2c, address=112, auto_write=True*)

Numeric 7-segment display. It has the same methods as the alphanumeric display, but only supports displaying a limited set of characters.

scroll (*count=1*)

Scroll the display by specified number of places.
