A CircuitPython driver for the MAX31856 Universal Thermocouple Amplifier

CHAPTER 1

Dependencies

This driver depends on:

- Adafruit CircuitPython
- Bus Device

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the [Adafruit library and driver bundle](#).

CHAPTER 2

Installing from PyPI

On supported GNU/Linux systems like the Raspberry Pi, you can install the driver locally [from PyPI](#). To install for current user:

```
pip3 install adafruit-circuitpython-max31856
```

To install system-wide (this may be required in some cases):

```
sudo pip3 install adafruit-circuitpython-max31856
```

To install in a virtual environment in your current project:

```
mkdir project-name && cd project-name  
python3 -m venv .env  
source .env/bin/activate  
pip3 install adafruit-circuitpython-max31856
```

CHAPTER 3

Usage Example

```
import board
import digitalio
import adafruit_max31856

# Create sensor object, communicating over the board's default SPI bus
spi = board.SPI()

# allocate a CS pin and set the direction
cs = digitalio.DigitalInOut(board.D5)
cs.direction = digitalio.Direction.OUTPUT

# create a thermocouple object with the above
thermocouple = adafruit_max31856.MAX31856(spi, cs)

# print the temperature!
print(thermocouple.temperature)
```

CHAPTER 4

Contributing

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

CHAPTER 5

Documentation

For information on building library documentation, please check out [this guide](#).

CHAPTER 6

Table of Contents

6.1 Simple test

Ensure your device works with this simple test.

(continued from previous page)

```
56     print("")  
57  
58     time.sleep(1.0)
```

6.3 MAX31856

CircuitPython module for the MAX31856 Universal Thermocouple Amplifier. See examples/simpletest.py for an example of the usage.

- Author(s): Bryan Siepert

6.3.1 Implementation Notes

Hardware:

- Adafruit Universal Thermocouple Amplifier MAX31856 Breakout (Product ID: 3263)

Software and Dependencies:

- Adafruit CircuitPython firmware for the supported boards: <https://circuitpython.org/downloads>
- Adafruit's Bus Device library: https://github.com/adafruit/Adafruit_CircuitPython_BusDevice

```
class adafruit_max31856.MAX31856(spi, cs, thermocouple_type=3)
```

Driver for the MAX31856 Universal Thermocouple Amplifier

Parameters

- **spi** (*SPI*) – The SPI bus the MAX31856 is connected to.
- **cs** (*Pin*) – The pin used for the CS signal.
- **thermocouple_type** (*ThermocoupleType*) – The type of thermocouple. Default is Type K.

Quickstart: Importing and using the MAX31856

Here is an example of using the *MAX31856* class. First you will need to import the libraries to use the sensor

```
import board  
from digitalio import DigitalInOut, Direction  
import adafruit_max31856
```

Once this is done you can define your `board.SPI` object and define your sensor object

```
spi = board.SPI()  
cs = digitalio.DigitalInOut(board.D5) # Chip select of the MAX31856  
sensor = adafruit_max31856.MAX31856(spi, cs)
```

Now you have access to the `temperature` attribute

```
temperature = sensor.temperature
```

fault

A dictionary with the status of each fault type where the key is the fault type and the value is a bool if the fault is currently active

Key	Fault type
“cj_range”	Cold junction range fault
“tc_range”	Thermocouple range fault
“cj_high”	Cold junction high threshold fault
“cj_low”	Cold junction low threshold fault
“tc_high”	Thermocouple high threshold fault
“tc_low”	Thermocouple low threshold fault
“voltage”	Over/under voltage fault
“open_tc”	Thermocouple open circuit fault

reference_temperature

The temperature of the cold junction in degrees Celsius. (read-only)

reference_temperature_thresholds

The cold junction's low and high temperature thresholds as a (`low_temp, high_temp`) tuple

temperature

The temperature of the sensor and return its value in degrees Celsius. (read-only)

temperature_thresholds

The thermocouple's low and high temperature thresholds as a (`low_temp, high_temp`) tuple

class adafruit_max31856.ThermocoupleType

An enum-like class representing the different types of thermocouples that the MAX31856 can use. The values can be referenced like `ThermocoupleType.K` or `ThermocoupleType.S`. Possible values are

- `ThermocoupleType.B`
- `ThermocoupleType.E`
- `ThermocoupleType.J`
- `ThermocoupleType.K`
- `ThermocoupleType.N`
- `ThermocoupleType.R`
- `ThermocoupleType.S`
- `ThermocoupleType.T`
