CircuitPython driver for the MAX7219 LED matrix driver chip.

See [here](#) for the equivalent MicroPython driver.

# CHAPTER 1

---

## Dependencies

---

This driver depends on:

- [Adafruit CircuitPython](#)

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the [Adafruit library and driver bundle](#).

## CHAPTER 2

---

### Installing from PyPI

---

On supported GNU/Linux systems like the Raspberry Pi, you can install the driver locally [from PyPI](#). To install for current user:

```
pip3 install adafruit-circuitpython-max7219
```

To install system-wide (this may be required in some cases):

```
sudo pip3 install adafruit-circuitpython-max7219
```

To install in a virtual environment in your current project:

```
mkdir project-name && cd project-name
python3 -m venv .env
source .env/bin/activate
pip3 install adafruit-circuitpython-max7219
```

### 3.1 adafruit\_max7219.Matrix8x8 Example

```
from adafruit_max7219 import matrices
from board import TX, RX, A2
import busio
import digitalio
import time

clk = RX
din = TX
cs = digitalio.DigitalInOut(A2)

spi = busio.SPI(clk, MOSI=din)
display = matrices.Matrix8x8(spi, cs)
while True:
    display.brightness(3)

    display.fill(1)
    display.pixel(3, 3)
    display.pixel(3, 4)
    display.pixel(4, 3)
    display.pixel(4, 4)
    display.show()
    time.sleep(3.0)

    display.clear_all()
    s = 'Hello, World!'
    for c in range(len(s)*8):
        display.fill(0)
        display.text(s, -c, 0)
        display.show()
        time.sleep(0.25)
```

## 3.2 adafruit\_max7219.BCDDigits Example

```
from adafruit_max7219 import bcddigits
from board import TX, RX, A2
import bitbangio
import digitalio

clk = RX
din = TX
cs = digitalio.DigitalInOut(A2)

spi = bitbangio.SPI(clk, MOSI=din)
display = bcddigits.BCDDigits(spi, cs, nDigits=8)
display.clear_all()
display.show_str(0, '{:9.2f}'.format(-1234.56))
display.show()
```

## CHAPTER 4

---

### Contributing

---

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

## CHAPTER 5

---

### Documentation

---

For information on building library documentation, please check out [this guide](#).

## 6.1 Simple test

Ensure your device works with this simple test.

## 6.2 adafruit\_max7219.max7219 - MAX7219 LED Matrix/Digit Display Driver

CircuitPython library to support MAX7219 LED Matrix/Digit Display Driver. This library supports the use of the MAX7219-based display in CircuitPython, either an 8x8 matrix or a 8 digit 7-segment numeric display.

## 6.3 See Also

- `matrices.Maxtrix8x8` is a class support an 8x8 led matrix display
- `bcddigits.BCDDigits` is a class that support the 8 digit 7-segment display

Beware that most CircuitPython compatible hardware are 3.3v logic level! Make sure that the input pin is 5v tolerant.

- Author(s): Michael McWethy

### 6.3.1 Implementation Notes

#### Hardware:

- Adafruit [MAX7219CNG LED Matrix/Digit Display Driver - MAX7219](#) (Product ID: 453)

#### Software and Dependencies:

- Adafruit CircuitPython firmware for the ESP8622 and M0-based boards: <https://github.com/adafruit/circuitpython/releases>
- Adafruit's Bus Device library: [https://github.com/adafruit/Adafruit\\_CircuitPython\\_BusDevice](https://github.com/adafruit/Adafruit_CircuitPython_BusDevice)

**Notes:** #. Datasheet: <https://cdn-shop.adafruit.com/datasheets/MAX7219.pdf>

**class** `adafruit_max7219.max7219.MAX7219` (*width: int, height: int, spi: busio.SPI, cs: digitalio.DigitalInOut, \*, baudrate: int = 8000000, polarity: int = 0, phase: int = 0*)  
 MAX7219 - driver for displays based on max719 chip\_select

#### Parameters

- **width** (*int*) – the number of pixels wide
- **height** (*int*) – the number of pixels high
- **spi** (*SPI*) – an spi busio or spi bitbangio object

- **chip\_select** (*DigitalInOut*) – digital in/out to use as chip select signal
- **baudrate** (*int*) – for SPIDevice baudrate (default 8000000)
- **polarity** (*int*) – for SPIDevice polarity (default 0)
- **phase** (*int*) – for SPIDevice phase (default 0)

**brightness** (*value: int*) → None  
Controls the brightness of the display.

**Parameters** **value** (*int*) – 0->15 dimmest to brightest

**fill** (*bit\_value: int*) → None  
Fill the display buffer.

**Parameters** **bit\_value** (*int*) – value > 0 set the buffer bit, else clears the buffer bit

**init\_display** () → None  
Must be implemented by derived class (*matrices*, *bcddigits*)

**pixel** (*xpos: int, ypos: int, bit\_value: int = None*) → None  
Set one buffer bit

**Parameters**

- **xpos** (*int*) – x position to set bit
- **ypos** (*int*) – y position to set bit
- **bit\_value** (*int*) – value > 0 sets the buffer bit, else clears the buffer bit

**scroll** (*delta\_x: int, delta\_y: int*) → None  
Srcolls the display using *delta\_x*, *delta\_y*.

**Parameters**

- **delta\_x** (*int*) – positions to scroll in the x direction
- **delta\_y** (*int*) – positions to scroll in the y direction

**show** () → None  
Updates the display.

**write\_cmd** (*cmd: int, data: int*) → None  
Writes a command to spi device.

**Parameters**

- **cmd** (*int*) – register address to write data to
- **data** (*int*) – data to be written to commanded register

## 6.4 adafruit\_max7219.matrices.Matrix8x8

**class** `adafruit_max7219.matrices.Matrix8x8` (*spi: busio.SPI, cs: digitalio.DigitalInOut*)  
Driver for a 8x8 LED matrix based on the MAX7219 chip.

**Parameters**

- **spi** (*SPI*) – an spi busio or spi bitbangio object
- **cs** (*DigitalInOut*) – digital in/out to use as chip select signal

**clear\_all** () → None  
Clears all matrix leds.

**init\_display** () → None  
Must be implemented by derived class (matrices, bcddigits)

**text** (strg: str, xpos: int, ypos: int, bit\_value: int = 1) → None  
Draw text in the 8x8 matrix.

**Parameters**

- **strg** (str) – string to place in to display
- **xpos** (int) – x position of LED in matrix
- **ypos** (int) – y position of LED in matrix
- **bit\_value** (int) – > 1 sets the text, otherwise resets

## 6.5 adafruit\_max7219.bcddigits.BCDDigits

**class** adafruit\_max7219.bcddigits.BCDDigits (spi: busio.SPI, cs: digitalio.DigitalInOut, nDigits: int = 1)

Basic support for display on a 7-Segment BCD display controlled by a Max7219 chip using SPI.

**Parameters**

- **spi** (SPI) – an spi busio or spi bitbangio object
- **cs** (DigitalInOut) – digital in/out to use as chip select signal
- **nDigits** (int) – number of led 7-segment digits; default 1; max 8

**clear\_all** () → None  
Clear all digits and decimal points.

**init\_display** () → None  
Must be implemented by derived class (matrices, bcddigits)

**set\_digit** (dpos: int, value: int) → None  
Display one digit.

**Parameters**

- **dpos** (int) – the digit position; zero-based
- **value** (int) – integer ranging from 0->15

**set\_digits** (start: int, values: List[int]) → None  
Display digits from a list.

**Parameters**

- **start** (int) – digit to start display zero-based
- **values** (list [int]) – list of integer values ranging from 0->15

**show\_dot** (dpos: int, bit\_value: int = None) → None  
The decimal point for a digit.

**Parameters**

- **dpos** (int) – the digit to set the decimal point zero-based
- **bit\_value** (int) – value > zero lights the decimal point, else unlights the point

**show\_help** (*start: int*) → None

Display the word HELP in the display.

**Parameters** **start** (*int*) – start position to show HELP

**show\_str** (*start: int, strg: str*) → None

Displays a numeric str in the display. Shows digits 0-9, -, and ..

**Parameters**

- **start** (*int*) – start position to show the numeric string
- **strg** (*str*) – the numeric string
