	<b>Python Module Index</b>	<b>17</b>

Classes for use in communicating with devices on a 1-Wire bus.

# CHAPTER 1

---

## Dependencies

---

This driver depends on:

- [Adafruit CircuitPython](#)

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the [Adafruit library and driver bundle](#).

## CHAPTER 2

---

### Usage Example

---

```
import board
from adafruit_owewire.bus import OneWireBus
ow_bus = OneWireBus(board.D2)
devices = ow_bus.scan()
for d in devices:
    print("ROM={}\tFamily=0x{:02x}".format(d.rom, d.family_code))
```

## CHAPTER 3

---

### Contributing

---

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

## CHAPTER 4

---

### Building locally

---

To build this library locally you'll need to install the `circuitpython-build-tools` package.

```
python3 -m venv .env
source .env/bin/activate
pip install circuitpython-build-tools
```

Once installed, make sure you are in the virtual environment:

```
source .env/bin/activate
```

Then run the build:

```
circuitpython-build-bundles --filename_prefix adafruit-circuitpython-onewire --
↳library_location .
```

### 4.1 Sphinx documentation

Sphinx is used to build the documentation based on rST files and comments in the code. First, install dependencies (feel free to reuse the virtual environment from above):

```
python3 -m venv .env
source .env/bin/activate
pip install Sphinx sphinx-rtd-theme
```

Now, once you have the virtual environment activated:

```
cd docs
sphinx-build -E -W -b html . _build/html
```

This will output the documentation to `docs/_build/html`. Open the `index.html` in your browser to view them. It will also (due to `-W`) error out on any warning like Travis will. This is a good way to locally verify it will pass.

## 5.1 Simple test

Ensure your device works with this simple test.

Listing 1: examples/onewire\_demo.py

```
1 import board
2 from adafruit_onewire.bus import OneWireBus
3
4 # Create the 1-Wire Bus
5 # Use whatever pin you've connected to on your board
6 ow_bus = OneWireBus(board.D2)
7
8 # Reset and check for presence pulse.
9 # This is basically - "is there anything out there?"
10 print("Resetting bus...", end='')
11 if ow_bus.reset():
12     print("OK.")
13 else:
14     raise RuntimeError("Nothing found on bus.")
15
16 # Run a scan to get all of the device ROM values
17 print("Scanning for devices...", end='')
18 devices = ow_bus.scan()
19 print("OK.")
20 print("Found {} device(s)".format(len(devices)))
21
22 # For each device found, print out some info
23 for i, d in enumerate(devices):
24     print("Device {:>3}".format(i))
25     print("\tSerial Number = ", end='')
26     for byte in d.serial_number:
27         print("0x{:02x} ".format(byte), end='')
```

(continues on next page)

(continued from previous page)

```

28     print("\n\tFamily = 0x{:02x}".format(d.family_code))
29
30 # Usage beyond this is device specific. See a CircuitPython library for a 1-Wire
31 # device for examples and how OneWireDevice is used.

```

## 5.2 adafruit\_owewire.bus

Provide access to a 1-Wire bus.

- Author(s): Carter Nelson

**class** `adafruit_owewire.bus.OneWireAddress` (*rom*)

A class to represent a 1-Wire address.

**crc**

The 8 bit CRC.

**family\_code**

The 8 bit family code.

**rom**

The unique 64 bit ROM code.

**serial\_number**

The 48 bit serial number.

**class** `adafruit_owewire.bus.OneWireBus` (*pin*)

A class to represent a 1-Wire bus.

**static crc8** (*data*)

Perform the 1-Wire CRC check on the provided data.

**Parameters** *data* (*bytearray*) – 8 byte array representing 64 bit ROM code

**readinto** (*buf*, \*, *start=0*, *end=None*)

Read into *buf* from the device. The number of bytes read will be the length of *buf*.

If *start* or *end* is provided, then the buffer will be sliced as if `buf[start:end]`. This will not cause an allocation like `buf[start:end]` will so it saves memory.

**Parameters**

- **buf** (*bytearray*) – buffer to write into
- **start** (*int*) – Index to start writing at
- **end** (*int*) – Index to write up to but not include

**reset** (*required=False*)

Perform a reset and check for presence pulse.

**Parameters** **required** (*bool*) – require presence pulse

**scan** ()

Scan for devices on the bus and return a list of addresses.

**write** (*buf*, \*, *start=0*, *end=None*)

Write the bytes from *buf* to the device.

If *start* or *end* is provided, then the buffer will be sliced as if `buffer[start:end]`. This will not cause an allocation like `buffer[start:end]` will so it saves memory.

**Parameters**

- **buf** (*bytearray*) – buffer containing the bytes to write
- **start** (*int*) – Index to start writing from
- **end** (*int*) – Index to read up to but not include

**exception** `adafruit_owewire.bus.OneWireError`

A class to represent a 1-Wire exception.

## 5.3 `adafruit_owewire.device`

Provides access to a single device on the 1-Wire bus.

- Author(s): Carter Nelson

**class** `adafruit_owewire.device.OneWireDevice` (*bus, address*)

A class to represent a single device on the 1-Wire bus.

**readinto** (*buf, \*, start=0, end=None*)

Read into `buf` from the device. The number of bytes read will be the length of `buf`.

If `start` or `end` is provided, then the buffer will be sliced as if `buf[start:end]`. This will not cause an allocation like `buf[start:end]` will so it saves memory.

**Parameters**

- **buf** (*bytearray*) – buffer to write into
- **start** (*int*) – Index to start writing at
- **end** (*int*) – Index to write up to but not include

**write** (*buf, \*, start=0, end=None*)

Write the bytes from `buf` to the device.

If `start` or `end` is provided, then the buffer will be sliced as if `buffer[start:end]`. This will not cause an allocation like `buffer[start:end]` will so it saves memory.

**Parameters**

- **buf** (*bytearray*) – buffer containing the bytes to write
- **start** (*int*) – Index to start writing from
- **end** (*int*) – Index to read up to but not include

## CHAPTER 6

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`

**a**

`adafruit_owewire.bus`, [12](#)

`adafruit_owewire.device`, [13](#)

## A

adafruit\_owewire.bus (module), 12  
adafruit\_owewire.device (module), 13

## C

crc (adafruit\_owewire.bus.OneWireAddress attribute), 12  
crc8() (adafruit\_owewire.bus.OneWireBus static method),  
12

## F

family\_code (adafruit\_owewire.bus.OneWireAddress at-  
tribute), 12

## O

OneWireAddress (class in adafruit\_owewire.bus), 12  
OneWireBus (class in adafruit\_owewire.bus), 12  
OneWireDevice (class in adafruit\_owewire.device), 13  
OneWireError, 13

## R

readinto() (adafruit\_owewire.bus.OneWireBus method),  
12  
readinto() (adafruit\_owewire.device.OneWireDevice  
method), 13  
reset() (adafruit\_owewire.bus.OneWireBus method), 12  
rom (adafruit\_owewire.bus.OneWireAddress attribute),  
12

## S

scan() (adafruit\_owewire.bus.OneWireBus method), 12  
serial\_number (adafruit\_owewire.bus.OneWireAddress  
attribute), 12

## W

write() (adafruit\_owewire.bus.OneWireBus method), 12  
write() (adafruit\_owewire.device.OneWireDevice  
method), 13
